The earlier geologists used this term as designating all strata above the secondary; but later discoveries have tended to modify its sense by way of restriction. As now employed the term *tertiary formation* designates the rock-system extending from the chalk (the highest member of the secondary), on which it rests, to the base of the post-tertiary system, which latter, according to some, includes the strata belonging to the glacial epoch, while others leave them in the tertiary. It is noteworthy that there is a complete and entire physical break between the rocks of the secondary or mesozoic and tertiary periods, the latter resting in no instance conformably on the former, while there is an equally complete break in the life of the two periods, not a single secondary animal or plant being known to have survived the cretaceous period with the exception of a few Foraminifera. In the tertiary rocks, on the other hand, not only are all the animals and plants more or less like existing types, but we meet with a constantly increasing proportion of living species as we pass from the bottom to the top. The classification of the tertiary formation is based on this increase, the strata being divided into two great groups as follows:— (1) The OLDER TERTIARY, comprising the *Eocene*, with five per cent of living species, and the *Miocene*, with twenty-five per cent. (2) The NEWER TERTIARY, comprising the *Older Pliocene*, containing fifty per cent of living species, and the *Newer Pliocene*, containing ninety-five per cent.

This word is therefore the same as *then*; so that 'this is better than that' is equivalent to 'this is better, then that'.] A particle used after certain adjectives and adverbs which express comparison or diversity, such as *more*, *better*, *other*, *otherwise*, *rather*, *else*, and the like, for the purpose of introducing the second member of the comparison. *Than* is usually followed by the object compared in the nominative case, but sometimes the object compared is placed in the objective case, and the particle is then considered by some grammarians as a preposition. Same root as obsolete verb *to the* or *thee*.] A title of honour among the Anglo-Saxons. In England a freeman not noble was raised to the rank of a thane by acquiring a certain portion of land—five hides for a lesser thane—by making three sea voyages, or by receiving holy orders. Every thane had the right of voting in the witenagemot, not only of the shire, but also of the kingdom, when important questions were to be discussed. With the growth of the kingly power the importance of the king's thanes (those in the personal service of the sovereign) rose above that of the highest gentry, ealdormen and bishops forming an inferior class. On the cessation of his actual personal service about the king the thane received a grant of land. After the Norman conquest thanes and barons were classed together. In the reign of Henry II. the title fell into disuse. In Scotland the thanes were a class of non-military tenants of the crown, and the title was in use till the end of the fifteenth century. The notion derived from Boece, and adopted by Shakspeare in 'Macbeth,' that the Scotch thanes were all transformed into earls, has no historical foundation.

2. A public celebration of divine goodness; also, a day set apart for religious services, specially to acknowledge the goodness of God either in any remarkable deliverance from calamities or danger, or in the ordinary dispensation of his bounties.—3. The species are mostly inhabitants of the countries of the Mediterranean. They are perennial herbs, with doubly or trebly pinnate leaves, large compound umbels, and yellow flowers. The roots possess acrid and corrosive properties. **That** (THAT), *a.* and *pron.* [A. Sax. *thæt*, neut. of the demonstrative and def. art. *se*, also *the* (masc.), *seō* (fem.), *thæt* (neut.); Goth. *sa*, *so*, *thata*, O. Fris. *thet*, Icel. *that*, D. *dat*, G. *das*. Cog. Skr. *sa*, *sa*, *sa*, *sa*. See also **THE**.] 1. A word used as a definitive adjective before a noun: (a) pointing to a person or thing as before mentioned or supposed to be understood; or used to designate a specific thing or person euphuistically, having more force than the definite article *the*, which may, however, in some cases be substituted for it.

It shall be more tolerable for Sodom and Gomorrah in the day of judgment, than for *that* city. *Mat. x. 15.*

The woman was made whole from *that* hour. *Mat. ix. 22.*

(b) Frequently used in opposition to *this*, in which case it refers to one of two objects already mentioned, and often to the one most distant in place or time; frequently, however, mere contradiction is implied; as, I will take *this* book, and you can take *that* one.

Of Zion it shall be said, *this* and *that* man was born in her. *Ps. lxxvii. 5.*

(c) Pointing not so much to persons and things as to their qualities, almost equivalent to *such*, or of such a nature, and occasionally followed by *as* or *that* as a correlative. 'There cannot be *that* vulture in you to devour so many.' *Shak.* 'Entertained with that ceremonious affection as you were wont.' *Shak.* 'Whose love was of that dignity *that*

it went hand in hand with the vow.' *Shak.*  
 2. Used absolutely or without a noun as a demonstrative pronoun (*a*) to indicate a person or thing already referred to or implied, or specially pointed at or otherwise indicated, and having generally the same force and significance as when used as an adjective; as, give me *that*; do you see *that*? (*b*) Used in opposition to *this*, or by way of distinction.

If the Lord will, we shall live, and do *this* or *that*.

*This* is not fair; nor profitable, *that*. *Dryden.*

When *this* and *that* refer to foregoing words, *this*, like the Latin *hic* or the French *ceci* (*this*), refers to the last mentioned, the latter, and *that*, like the Latin *ille* and French *celui*, to the first mentioned, the former. This is an artificial grammatical rule, probably founded on the Latin one, and adopted by writers, but it can scarcely be said to rest on any logical conception or law of thought.

Self-love and reason to one end aspire,  
 Pain their aversion, pleasure their desire;  
 But greedily *that*, its object would devour,  
*This* taste the honey, and not wound the flower. *Pope.*

In all the above cases, *that*, when referring to a plural noun, takes the plural form *those*; as, *that* man, *those* men; give me *that*, give me *those*; and so on. (*c*) Used to represent a sentence or part of a sentence, or a series of sentences.

And when Moses heard *that*, he was content.

*That* here stands for the whole of what Aaron had said, or the whole of the preceding verse.

I will know your business, *that* I will. *Shak.*

*That* sometimes in this use precedes the sentence or clause to which it refers.

*That* be far from thee, to do after this manner, to slay the righteous with the wicked. *Gen. xviii. 25.*

*That* here represents the clause in italics. It is used also as the substitute for an adjective; as, you allege that the man is innocent; *that* he is not. Similarly it is often used to introduce an explanation of something going before. 'Religion consists in living up to those principles, *that* is, in acting in conformity to them.' (*d*) Used emphatically, with a predicate, in phrases expressive of approbation, applause, or encouragement. 'Why, *that's* my dainty Ariell!' *Shak.* 'That's my good son!' *Shak.* (*e*) By the omission of the relative *that* often acquires the force of *that* which; this is, however, not in accordance with modern usage.

I earn *that* I eat, get *that* I wear. *Shak.*  
 We speak *that* we do know, and testify *that* we have seen. *Jn. iii. 21.*

3. Used as a relative pronoun, and in many cases equivalent to *who* or *which*. It cannot, however, be relatively used with a preposition preceding it, but may be so used when the preposition is transposed to the end of the clause; thus we say, the man of whom I spoke, the book from which I read, the spot near which he stood, the pay for which he works; but we cannot say the man of that I spoke, &c., though we may say, the man that I spoke of, the book that I read from, the place that he stood near, the pay that he works for, and so on. When the relative clause conveys an additional idea or statement, *who* and *which* are rather to be used than *that*, which, indeed, is sometimes inadmissible; thus we say: 'James, whom I saw yesterday, told me,' but not 'James that.' *That* properly introduces a restrictive and explanatory clause (as exemplified by 'The man that I spoke of,' &c.), and though *who* and *which* are frequently used in the same way, the use of *that* often avoids ambiguity. See under *Who*.

He that reproveth a scorner getteth to himself shame. *Prov. ix. 7.*

In the following extract *that*, *who*, and *which* are used without any perceptible difference.

Sometime like apes *that* mow and chatter at me  
 And after bite me, then like hedgehogs *which*  
 Lie tumbling in my barefoot way and mount  
 Their prickles at my footfall, sometime am I  
 All wound with adders, *who* with cloven tongues  
 Do hiss me into madness. *Shak.*

With its use as a relative are to be classed those cases in which it is used as a correlative to *so* or *such*. 'Who's so gross that cannot see this palpable device?' *Shak.* 'Who so firm that cannot be seduced?' *Shak.* 'Such allowed infirmities that honesty is never free of.' *Shak.*—*That*, as a demonstrative and as a relative pronoun, may

sometimes occur close together, but this use is now scarcely considered elegant.

*That* that is determined shall be done. *Dan. xi. 35.*  
*That* that dieth, let it die. *Zech. xi. 9.*

**That** (THAT), *conj.* 1. Introducing a reason; in that; because. 'Not that I loved Caesar less, but that I loved Rome more.' *Shak.*

It is not that I love you less  
 Than when before your feet I lay. *Walter.*

2. Introducing a drift or object or final end or purpose—the phrases in order that, for the purpose that, to the effect that.

Treat it kindly, *that* it may  
 Wish at least with us to stay. *Comely.*

3. Introducing a result or consequence.  
 The custom and familiarity of these tongues do sometimes so far influence the expressions in these epistles *that* one may observe the force of the Hebrew conjugations. *Locke.*

4. Introducing a clause as the subject or object of the principal verb, or as a necessary complement to a statement made.

'Tis childish error that they are afraid. *Shak.*  
 Albeit I will confess thy father's wealth  
 Was the first motive that I wou'd thee, Anne. *Shak.*

I have shewed before that a mere possibility to the contrary can by no means hinder a thing from being highly credible. *Bp. Wilkins.*

5. Added formerly to other conjunctions or to adverbs for the sake of emphasis.

'After that things are set in order here, we'll follow them.' 'Take my soul, before that England give the French the foil.'

'What would you with her if that I be she?'

'Since that my case is past the help of law.'

'When that my eye is famished for a look.'

*Shak.*—6. Used elliptically to introduce a sentence or clause expressive of surprise, indignation, or the like. 'That a brother should be so perfidious?' 'O God, that men should put an enemy in their mouths to steal away their brains!' *Shak.*—7. Used as an optative particle or to introduce a phrase expressing a wish. 'O, that you bore the mind that I do!' *Shak.*—In *that*, for the reason that; because.

Things are preached not *in that* they are taught, but *in that* they are published. *Hooker.*

It consists of a circular card, having two strings fixed to it at the extremities of a diameter. On one side of the card there is drawn any object, such as a chariot, and on the other the charioteer in the attitude of driving, so that when the card is twirled round rapidly by the strings the charioteer is seen driving the chariot.

Fris. *the*, *thi*, D. and L. G. *de*, Sw. and Dan. *den*, G. *der*. In Anglo-Saxon the article underwent inflection, and the *the* used before a comparative represents the instrumental case *thi*, *thij*, the English phrase the more the better thus corresponding closely to the Latin *quo magis*, *eo melius*.] 1. Used before nouns with a specifying or limiting effect; as, the laws of the twelve tables; the independent tribunals of justice in our country are the security of private rights and the best bulwark against arbitrary power; the sun is the source of light and heat.—2. distinction, and placed before family names with somewhat of the force of a title, indicating the head of the clan or family; as, *The Macnab*; *The Douglas*; *The O'Donoghue*.—4. Prefixed to adjectives used absolutely, giving them the force and functions of abstract nouns; as, a passion for the sublime and beautiful; the real and the ideal. 5. Used before adjectives and adverbs in the comparative degree, in which case it means by that; by how much; by so much; on that account; as, *the longer we continue in sin the more difficult it is to reform*. [*The* is generally pronounced with the vowel sound short, before a vowel somewhat like *i* in *pin*, before a consonant often more like *u* in *but*; but when used emphatically it is pronounced as *thee*. In poetry the *e* was formerly always, and is still sometimes, cut off in printing before a word beginning with a vowel sound. 'Shook *th'* arsenal and fulminated over Greece.' *Milton*. The old contracted form *y'* arose from a confusion between the old character for *th* and that for *y*—of course the *y* was never pronounced as *y*.]

**Thea** (thé'a), *n*. [See **TEA**.] A genus of plants, nat. order Ternstroemiaceæ, com-

prising the species yielding the tea of commerce. Although botanists are now for the most part agreed that tea is the produce of one species (*T. sinensis* or *chinensis*), yet different modes of culture persevered in for many centuries, as well as variations in climate and soil, have caused the original plant to diverge into two varieties so well marked as to be entitled to distinct names—viz. *T. viridis* and *T. bohea*. *T. viridis* is a large, hardy, evergreen plant, with spreading branches, its leaves 3 to 5 inches long, thin, very broadly lanceolate, light green and wavy, with large and irregular serratures, the flowers large, usually solitary, and of a white colour. It is found both in China and Japan. *T. bohea* is a smaller plant than *T. viridis*, and differs from it in several particulars. From either species, however, by means of a different process of manipulation in the manufac-

*Thea bohea*.

turing, both black and green tea are produced. Tea is cultivated in China over a great extent of territory. It is also extensively cultivated in Japan, Tonquin, Cochín-China, and Assam. In China the climate most congenial to it seems to be that between the 27th and 31st degree of north latitude. Its growth is chiefly confined to hilly tracts not suited to the growth of corn, and the

rearing of it requires great skill and attention, as well as the preparation of the leaves. It is perhaps impossible to state definitely the native country of the tea-plant. Hitherto the only country in which botanists have found it in a really wild state is Upper Assam, the plant indigenous to that country being known as *T. assamica* or *assamensis*. This botanists are inclined to regard as the original of *T. viridis* and *T. bohea*. See **TEA**.

One of an order of monks founded at Rome in 1524, principally by Gianpietro Caraffa, archbishop of Chieti, in Naples, the Latin name of which is *Teate*, hence the name (*Theatins* or *Teatins*) given to the order. Besides taking the usual monastic vows, the Theatins bound themselves to preach against heretics, to take upon them the cure of souls, to attend the sick and criminals, to abstain from possessing property, and not even to ask for alms, but to trust to Providence for support, expecting, however, that this support would be derived from the voluntary alms of the charitable. There were also Theatin nuns, who spent their whole time in solitude and prayer. The order flourished considerably in France, Spain, and Portugal, but its influence is now chiefly confined to the Italian provinces.

**Theatine** (thé'a-tin), *a*. Of or pertaining to the Theatines.

**Theatral** (thé'a-tral), *a*. Belonging to a theatre.

**Theatre** (thé'a-tér), *n*. [*Fr. théâtre*, from *L. theatrum*, from *Gr. theatron*, from *theaomai*, to see, *thea*, a view.] 1. A building appropriated to the representation of dramatic spectacles; a play-house. Among the Greeks and Romans theatres were the chief public edifices next to the temples, and in point of magnitude they surpassed the most spacious of the temples, having in some instances accommodation for as many as from 10,000 to 40,000 spectators. The Greek and Roman theatres very closely resemble each other in their general form and principal parts. The building was of an oblong, semicircular form, resembling the half of an amphitheatre, and was not covered by a roof. The space appropriated to the seats of the spectators was termed *cavea* by the Romans and *koilon* by the Greeks. The seats were all concentric with the orchestra, and were intersected in one direction by ascents or flights of steps, dividing the seats into so many compartments. The place for the players, in front of the seats, was called *scenæ* (*skênê*). The semicircular space between the scene and the seats of the spectators was called *orchestra* (*orchestra*), appropriated by the Greeks to the chorus and musicians, and by the Romans to the senators. Besides these essential parts there were the *pulchrum* or stage proper, the *proscenium*, and *postscenium*, with regard to which

parts the Greek and Roman theatres differed considerably. Scenery, in the modern sense of the word, was not employed,

but the stage machinery seems in many cases to have been elaborate. In the early days of the modern theatre the buildings were only partially roofed, and the stage but scantily if at all provided with scenery. The interior of the theatres of the present day are usually constructed on a horse-shoe or semicircular plan, and several tiers of galleries run round the walls. The orchestra is now solely occupied by the musicians of the establishment, and the stage, which has a slight downward slope from the back, is furnished with movable scenes, which give an air of reality to the spectacle quite unattainable in the ancient theatre.—2. A room, hall, or other place, generally with a platform at one end, and ranks of seats rising step-wise as they recede, or otherwise so arranged that a body of spectators can have an unobstructed view of the platform. Places of this description are constructed for public lectures, scholastic exercises, anatomical demonstrations, surgical operations before a class, and the like.—3. A place rising by steps or gradations like the seats of a theatre.

Shade above shade, a woody theatre.  
Of stateliest view. *Milton*.

4. A place or sphere of action or exhibition; a field of operations; the locality, district, or scene where a series of events takes place or may be observed; as, the theatre of war.

**Theft** (théft), *n.* [A. Sax. *theofth*, *théft*. See THEIF. Final *th* became *t*, as in *height* (which see).] 1. The act of stealing. In law, the general name for the most ordinary class of offences against property, for which English law uses the term larceny. Simple larceny, or theft, is committed by wrongfully taking, against the will of the owner, and carrying away the goods of another with the fraudulent and felonious intent wholly to deprive him of his property therein. Hence it requires an actual taking, and an actual carrying away for some distance, to constitute the offence. Compound larceny or theft is when the theft is accompanied by aggravating circumstances, as when it is committed upon the person, or consists in stealing from a dwelling-house. Taking from the person in a violent manner is robbery, and stealing in a dwelling-house after having broken therein is burglary. (See LARCENY.) In Scots law, theft is defined 'the intentional and clandestine taking away of the property of another from its legitimate place of deposit, or other locus tenendi, with the knowledge that it is another's, and the belief that he would not consent to its abstraction, and with the intention of never restoring it to the owner.'

**Theodolite** (thē-ō-dō-līt), *n.* [Perhaps from Gr. *thea*, a seeing, *hodos*, a way, and *litos*, plain, smooth, or from *thea*, and *doulos*, a slave. The term is said to occur first in Harris's *Lexicon Technicum*, a dictionary of the arts and sciences published at London in 1704–10, being applied to a simple instrument without glasses used in land-surveying.] A most important surveying instrument for measuring horizontal and vertical angles by means of a telescope the movements of which can be accurately marked. This instrument is variously constructed, but its main characteristics continue unaltered in all forms. One of the forms generally used is shown in the cut. A and B are two concentric horizontal circular plates which turn freely on each other. The lower or graduated plate B contains the divisions of the circle, and the upper or vernier plate has two vernier divisions a diametrically opposite, only one of which is shown in the cut. The vertical axis c

consists of two parts, the one working within the other. The external part is attached to the graduated plate B, and the internal to the vernier plate A. The plane

of the circle is adjusted to the horizon by the screws *b b b* acting against a plate of metal resting on the staff-head supporting the instrument. The vernier plate carries two spirit-levels *c c* at right angles to each other, by means of which the circle may be brought accurately into the horizontal plane. The horizontal axis of the vertical limb *E* of the instrument is supported by a frame firmly attached to the vernier plate, and turning along with it about the vertical axis. Parallel to the axis a telescope *D*, with an arrangement of fibres of unspun silk called cross-wires in the principal focus of its object-glass, is attached, which moves in the vertical plane by the movement of the graduated circle *E*, and is used for observing the objects whose angular distance is to be measured, and also for taking altitudes or measuring vertical angles; a spirit-level is fixed beneath the telescope for horizontal adjustment. *d* is a microscope for reading off the degrees on the horizontal circle; *e* one for those on the vertical limb. The screw *g* clamps the collar to the vertical axis *c*, and prevents motion; *h* turns the whole round. To measure the angular distance between any two objects, the telescope is turned round along with the vernier circle (the graduated circle remaining fixed) until it is brought to bear exactly upon one of the objects; it is then turned round until it is brought to bear on the other object, and the arc which the vernier has described on the graduated circle measures the angle required. The double vertical axis and the use of the clamps enable the observation to be repeated any number of times, in order to ensure accuracy. The theodolite is not only a most essential instrument in trigonometrical surveying for determining stations and running base-lines, but also in geodetical operations for assisting in determining the length of an arc of the meridian. For this latter purpose it requires to be constructed on a large scale.

**Theology** (thē-ol'ō-jī), *n.* [Fr. *théologie*, from Gr. *theologia*—*theos*, God, and *logos*, discourse.] Divinity; the entire science of the Christian religion; the science which treats of God and man in all their known relations to each other; the science which treats (a) of the character and attributes of God; (b) the doctrine of man in his relations to God; (c) the doctrine of the salvation of man through the person and work of Christ; (d) the doctrines of the final state of all men; and (e) the doctrine of the church, its constitution and government. In reference to the sources whence it is derived, theology is distinguished into *natural* or *philosophical* theology, which relates to the knowledge of God from his works by the light of nature and reason; and *supernatural*, *positive*, or *revealed* theology, which sets forth and systematizes the doctrines of the Scriptures. Theology is variously divided according to the method of treating the subject, and the part of the subject which is treated.—*Dogmatic* or *theoretical* theology, that part of the science which aims pre-eminently to state what is authoritatively taught, whether by the Scriptures, the councils, or the creeds.—*Exegetical* theology embraces the interpretation of the Scriptures, the science which teaches the principles to be observed in interpretation; and biblical criticism, which examines and tries to establish the genuine text, the authenticity of the various books of the Bible, and the discussion of kindred subjects.—*Historical* theology treats of the history of Christian doctrines, of heresies of the church, of councils, and the like.—*Metaphysical* theology aims to substantiate the teachings of the Bible by an appeal to those primitive cognitions and primary beliefs which the Bible always assumes.—*Moral* theology, a term formerly in use, covered the ground now occupied by moral philosophy or Christian ethics.—*Polemical* theology, or theological controversy, seeks to overthrow the positions of other systems as well as to defend its own.—*Practical* theology consists of an exhibition, first, of precepts and directions, and secondly, of the motives from which we should be expected to comply with these.—

*Rational* theology gives to human reason the highest authority in determining what is theological truth.—*Scholastic* theology either proceeds by reasoning or derives the knowledge of divine things from certain established principles of faith.—*Speculative* theology, a system in which theory predominates over Scripture and all other authority.—*Systematic* theology arranges methodically the great truths of religion, so as to enable us to contemplate them in their natural connection, and to perceive both the mutual dependence of the parts and the symmetry of the whole. See RELIGION.

A *theorem* wants demonstration only; a *problem* requires solution, or the discovery both of method and demonstration.—2. A speculative truth; a position laid down as an acknowledged truth; that which is considered and established as a principle. By my *theorems*, Which your polite and terser gallants practise, I re-refine the court, and civilize Their barbarous natures. *Massinger.*

3. An exposition of the general or abstract principles of any science; as, the *theory* of music; the *theory* of medicine.—4. The science distinguished from the art; the rules of an art, as distinguished from the practice; to be learned in an art, the *theory* is sufficient; to be master of it, both the *theory* and practice are requisite.—5. In science, a philosophical explanation of phenomena; a connected arrangement of facts, according to their bearing on some real or hypothetical law or laws; as, the *theory* of gravitation, the atomic *theory*, *theories* of light, *theories* of heat, *theory* of combustion, lunar *theory*, *theory* of dew, *theories* of the earth, *theory* of moral sentiments, &c.

Practice alone divides the world into virtuous and vicious; but as to the *theory* and speculation of virtue and vice, mankind are much the same. *South.* A theory is often nothing else but a contrivance for comprehending a certain number of facts under one expression. Many theories are founded entirely on analogy, and such theories may have all degrees of evidence from the least to the greatest. The evidence of a theory increases with the number of facts which it explains, and the precision with which it explains them. It diminishes with the number of facts which it does not explain, and with the number of different suppositions that will afford explanations equally precise. A theory may not deserve to be rejected because it does not explain all the phenomena, if it explains a great number and be not absolutely inconsistent with any one, but a single fact inconsistent with any theory may be sufficient to overturn it.—*Theory* is distinguished from *hypothesis* thus: a *theory* is founded on inferences drawn from principles which have been established on independent evidence; a *hypothesis* is a proposition assumed to account for certain phenomena, and has no other evidence of its truth than that it affords a satisfactory explanation of those phenomena. It is necessary to keep this distinction in view, as the terms *theory* and *hypothesis* are very frequently confounded both in speaking and writing.

In this they differ from the mystics, who have been styled *theopneustic*, whose object is passively to receive the supposed communication of the divinity, and expatiate on the results. The best-known names at this day of the theosophic order are those of Jacob Bohme, Madame Guyon, Swedenborg, and Saint-Martin. **Thermo-electricity** (thêr-mô-ê-lek-tris'-i-tî), *n.* 1. Electricity produced at the junction of two metals, or at a point where a molecular change occurs in a bar of the same metal, when the junction or point is heated above or cooled below the general temperature of the conductor. Thus when wires or bars of metal of different kinds, as bis-

moth and antimony, are placed in close contact, end to end, and disposed so as to form a periphery or continuous circuit, and heat then applied to the ends or junctions of the bars, electric currents are produced. — 2. The science that treats of the electric currents that arise from heating the junction of two heterogeneous conductors. — *Thermo-electric alarm*, an apparatus designed to indicate the rise of temperature beyond a certain desired point; as for instance to show when the bearings of shaftings are overheated, or when a room is too warm from overheating or in danger from fire. It consists of a thermometer having a wire passing through the bulb, and so connected with the mercury; and another entering the tube at the top, and extending a certain distance downwards. Each of these wires is connected with a small open circuit having an electric battery and bell. Suppose the presence of fire in an apartment may be inferred from the temperature rising to 100°, this actual rise may be indicated by having the end of the top wire set in the tube opposite this degree on the scale. When the mercury rises and touches 100° the circuit is completed and the bell rung. — *Thermo-electric battery*, or *pile*, an apparatus much used in delicate experiments with radiant heat. It consists of a series of little bars of antimony and bismuth (or any other two metals of different heat-conducting power), having their ends soldered together and arranged in a compact form; the opposite ends of the pile being connected with a galvanometer, which is very sensibly affected by the electric current induced in the system of bars when exposed to the slightest variations of temperature. To the combined arrangement of pile and galvanometer the name of thermo-multiplier is given. — *Thermo-electric pair*, two metal bars of different heat-conducting power, having their ends soldered together, and the combined bar then usually bent into a more or less horse-shoe or magnet form for the purpose of bringing their free ends within a conveniently short distance. They are used in thermo-electric experiments, but as the electric current developed in a single pair is very weak, a considerable number are usually combined, thus forming the thermo-electric pile or battery. Bismuth and antimony are the metals usually employed, the difference in electro-motive force being greater between them than between any other two metals conveniently obtainable.

**Thermo-magnetism** (thêr-mô-mag'-net-izm), *n.* Magnetism resulting from, or as affected by, the action of heat.

**Thermometer** (thêr-mom'-et-êr), *n.* [Gr. *thermos*, warm, from *thermê*, heat, and *metron*, measure.] An instrument by which the temperatures of bodies are ascertained; founded on the property which heat possesses of expanding all bodies, the rate or quantity of expansion being supposed proportional to the degree of heat applied, and hence indicating that degree. The thermometer consists of a slender glass tube, with a small bore, containing in general mercury or alcohol, which expanding or contracting by variations in the temperature of the atmosphere, or on the instrument being brought into contact with any other body, or immersed in a liquid or gas which is to be examined, the state of the atmosphere, the body, liquid, or gas, with regard to heat, is indicated by a scale either applied to the tube or engraved on its exterior surface. The ordinary thermometer consists of a small tube, terminating in a ball containing mercury, the air having been expelled and

the tube hermetically sealed. There are two points on the scale, corresponding to fixed and determinate temperatures, one, namely, to the temperature of freezing water, and the other to that of boiling water. In the thermometer commonly used in this country, that of Fahrenheit, the former point is marked 32° and the latter 212°; hence the zero of the scale, or that part marked 0°, is 32° below the freezing-point, and the interval or space between the freezing and boiling points consists of 180°. The zero point is supposed to have been fixed by Fahrenheit at the point of greatest cold that he had observed, probably by means of a freezing-mixture such as snow and salt. On the Continent, particularly in France, and nowadays in all scientific investigations, the Centigrade thermometer is used. The space between the freezing and boiling points of water is divided into 100 equal parts or degrees, the zero being at freezing and the boiling-point at 100°. Réaumur's thermometer, which is in use in Germany, has the space between the freezing and boiling points divided into 80 equal parts, the zero being at freezing. The following formulae will serve to convert any given number of degrees of Fahrenheit's scale into the corresponding number of degrees on Réaumur's and the Centigrade scales, and vice versa: Let F, R, and C (the ° of C. and R. being equal to F. 32°, and the three scales from freezing to boiling point being F. 180°, C. 100°, R. 80°, or in the ratio of 9°, 5°, 4°) represent any corresponding numbers of degrees on the three scales respectively, then:  $(F - 32) \times \frac{5}{9} = R$ ;  $(F - 32) \times \frac{4}{9} = C$ ;  $R \times \frac{9}{5} + 32 = F$ ;  $C \times \frac{9}{5} + 32 = F$ ;  $C \times \frac{4}{5} = R$ ;  $R \times \frac{5}{4} = C$ . For extreme degrees of cold, thermometers filled with spirit of wine must be employed, as no degree of cold known is capable of freezing that liquid, whereas mercury freezes at about 39° below zero on the Fahrenheit scale. On the other hand, spirit of wine is not adapted to high temperatures, as it is soon converted into vapour, whereas mercury does not boil till its temperature is raised to 660° F. Mercury is most commonly used for thermometers employed for indicating all ordinary temperatures. For recording extremely high temperatures the pyrometer is used; and for indicating very slight variations the thermo-electric battery is employed. As the ordinary thermometer gives the temperature only at the time of observation, the necessity for having an instrument which would show the maximum and minimum temperatures within a given period is easily apparent in all cases connected with meteorology, and various forms of instruments for this purpose have been invented. A common form of *maximum thermometer* consists of the ordinary thermometer fitted with a piston which moves easily in the tube. The instrument is placed horizontally, and the piston is pushed along the bore as the mercury advances, and is left at the highest point by the retreating fluid. This point is noted by the observer, who then erects the thermometer, causing the piston to sink to the mercury, the instrument thus being in condition for a fresh experiment. A similar action takes place in the spirit of wine *minimum thermometer*, the small movable piston being, however, immersed in the fluid and drawn back by the convex surface of the contracting fluid, being left at the point of greatest contraction. The maximum and minimum instruments combined form the *register* or *self-registering thermometer*.—*Chromatic thermometer*, an arrangement of glass plates devised by Sir David Brewster, exhibiting the difference between their temperature and that of an object with which they are brought in contact by the different hues of the polarized light produced in the plates.—*Differential thermometer*. See DIFFERENTIAL.

A thermostat was contrived by Dr. Ure for regulating temperature in the processes of distillation and vaporization in baths, hot-houses, in adjusting the heat of stoves and furnaces, &c. It operates upon the principle that when two thin metallic bars of different degrees of expansibility are riveted or soldered faceways together, any change of temperature will cause the compound bar to bend, the side on which the least expandable bar is becoming concave, and the other convex. These flexures are made to operate in regulating valves, stop-cocks, stove-registers, &c., and thereby to regulate the flow of heated liquids, or the admission or emission of air.

The degree of tensile force applied is determined beforehand by trials on the same quality of metal at the ordinary temperature, in order to ascertain what force would, in that case, have been sufficient to break the piece which is to be submitted to thermo-tension.

Dr. Morris.

The loss of the n produced the more modern form *thy*. *Thy*; belonging to thee; relating to thee; being the property of thee. The following quotations give examples of the euphonic use of *thine* before a vowel, while *thy* is used before a consonant.

Give every man *thine* ear, but few *thy* voice. Shak.

In these uses *thine*, &c., are used exactly like the possessive of a noun. It is to be observed that *thine*, like *thou*, is now used only in poetry, in solemn discourse, and in the common language of the Quakers. In familiar and common language *your* and *yours* are always used in the singular number as well as the plural.

A term used to denote the sensations arising from the want of fluid nutriment; the desire, uneasiness, or suffering occasioned by want of drink; vehement desire for drink. The sensations of thirst are chiefly referred to the thorax and fauces, but the condition is really one affecting the entire body. The excessive pains of thirst compared with those of hunger are due to the fact that the deprivation of liquids is a condition with which all the tissues sym-

thize. Every solid and every fluid of the body contains water, and hence abstraction or diminution of the watery constituents is followed by a general depression of the whole system. Thirst is a common symptom of febrile and other diseases.

When they heard *this*, they were pricked in their heart. Ac. ii. 37.

In the latter passage *this* is a substitute for what had preceded, viz. the discourse of Peter just delivered. In like manner *this* often represents a word, a sentence, or clause, or a series of sentences or events. In some cases it refers to what is to be immediately related or done.

But know *this*, that if the Goodman of the house had known in what watch the thief would come, he would have watched, and would not have suffered his house to be broken up. Mat. xxiv. 43.

It is often used for *these*, the sum being reckoned up, as it were, in a total. 'This two and thirty years.' Shak.

I have not vent *this* forty years; but now My mother comes afresh into my eyes. Dryden.

The plural, however, is now more commonly used by writers in such cases (c) 'Time next to come.' 'This night I'll waste in sorrow.' Shak.

I learn'd in Worcester as I rode along, He cannot draw his power *this* fourteen days. Shak.

In Shakspeare the phrases *this even* and *this night* occur, meaning *last even*, *last night*.—By *this*, by this time; as, by *this* the mail has arrived.

By *this* the vessel half her course had run. Dryden.

*This* other day, very lately; the other day. You denied to fight with me *this* other day. Shak.

3. *This* is frequently used to signify present place, state, condition, position, or the like; as, *this* (state of matters) is rather unpleasant.

Since he left *this*, . . . he never as much as bestowed a thought upon us. Lever.

4. *This* is used as opposed or correlative to *that*. *This* refers to the nearest person or thing; *that* to the most distant. Frequently, however, *this* and *that* denote reference indefinitely.

**Thistle** (this'l), *n.* [A. Sax. *thistel*, Icel. *thistill*, G. and D. *distel*, Sw. *tistel*, Sc. *thistle*, thistle. Origin doubtful.] The common name of prickly plants of the tribe Cynaraceæ, nat. order Compositæ. The genus *Carduus* with its sub-genera *Cirsium* or *Cnicus* and *Silybum* contains the greatest number of those commonly recognized. There are numerous species, most of which are inhabitants of Europe, as the musk-thistle (*Carduus nutans*), milk-thistle (*C. Marianus*), welted thistle (*C. acanthoides*), slender-flowered thistle (*C. tenuiflorus*), the spear-thistle (*Cnicus lanceolatus*), and field thistle (*Cnicus arvensis*), a well-known plant, very troublesome to the farmer. The blessed-thistle (*Carduus benedictus*) of the pharmacopœias, *Cnicus benedictus* or *Cirsium benedictum* of modern botanists, is a native of the Levant,

and is a laxative and tonic medicine. The name thistle is also given to numerous prickly plants belonging to other genera, as the cotton-thistle belongs to the genus *Onopordum*. The common cotton-thistle (*O. Acanthium*) attains a height of from 4 to 6 feet. It is often cultivated as the Scotch thistle, but it is doubtful whether the thistle which constitutes the national badge has any existing type, though the stemless thistle (*Cnicus aculea* or *Cirsium aculea*) is in many districts of Scotland looked on as the true Scotch thistle. The carline thistle belongs to the genus *Carlina*; the star-thistle is the *Centaurea Calcitrapa*. The sow-thistle belongs to the genus *Sonchus*, and the globe-thistle to the genus *Echinops*. Some species of the thistle are admitted into gardens, where they form a pretty variety for borders. Thistles sow themselves extensively by means of their winged seeds, and hence they are great pests to the farmer. The thistle seems to have been a national emblem in Scotland in the time of James III., and it was evidently well known as such when Dunbar wrote his poem of the 'Thistle and the Rose' (1503).—Order of the Thistle, a Scottish order of knighthood, sometimes called the order of St. Andrew. It was instituted by James VII. (James II. of England) in 1687, when

Order of the Thistle—Star, Jewel, Badge, and Collar.

eight knights were nominated. It fell into abeyance during the reign of William and Mary, but was revived by Queen Anne in 1703. The insignia of the order consist of a gold collar composed of thistles interlaced with sprigs of rue; the jewel, a figure of St. Andrew in the middle of a star of eight pointed rays, suspended from the collar; the star, of silver and eight-rayed, four of the rays being pointed, while the alternate rays are shaped like the tail-feathers of a bird, with a thistle in the centre surrounded by the Latin motto *Nemo me impune lacessit*; and the badge, oval, with the motto surrounding the figure of St. Andrew. The order consists of the sovereign and sixteen knights, besides extra knights (princes), and a dean, a secretary, the lion-king-at-arms, and the gentleman usher of the green rod.

Where I am, *thither* ye cannot come. Jn. vii. 34.

It is still used in elevated style, however, as also where *there* would be ambiguous. — 2. The common chord in its fundamental form is generally left unfigured, and accidentals are indicated by using sharps, naturals, or flats along with the figures. The term is often used in a wide sense as equivalent to the science of harmony, and sometimes even to musical science—a usage not to be recommended, as it tends to confusion.—*Thorough framing*, an old term for the framing of doors and windows.

Thrashing, Thrashing (thraash'ing, thraash'ing), n. 1. The operation by which grain is separated from the straw. This operation is performed in various ways, as by the feet of animals, by a flail, or by a thrashing-machine. The first mode was that employed in the ages of antiquity, and it is still practised in the south of Europe, and in Persia and India. Oxen were generally employed for this purpose, either alone or with the addition of a kind of roller studded with iron knots, which the oxen dragged over the corn-sheaves, which latter were spread on a circular floor in the form of a circle, the ends containing the grain being placed towards the centre. Thrashing by the flail is still practised in various parts of this and other countries, but thrashing-machines have been very extensively introduced, which effect a great saving in time and labour to the farmer.—2. A sound drubbing.

Thrashing-floor (thraash'ing-floor), n. A floor or area on which grain is beaten out. In eastern countries, from the earliest ages, thrashing-floors were in the open air; but in colder and moister climates, such as ours, such floors must be under cover, as in a barn.

Thrashing-machine, Thrashing-mill (thraash'ing-ma-shén, thraash'ing-mil), n. A machine for separating grain, as wheat,

oats, barley, &c., from the straw; and in which the moving power is that of horses, oxen, wind, water, or steam. The thrashing-machine was invented in Scotland in 1758 by Michael Stirling, a farmer in Perthshire; it was afterwards improved by Andrew

Section of Scotch Thrashing-machine.

Meikle, a millwright in East Lothian, about the year 1776. Since that time it has undergone various other improvements. The cut shows in section a machine of this kind as at present constructed. The principal feature is the three rotatory drums or cylinders, which receive motion from a water-wheel, or from horse or steam power. The first drum which comes into operation has projecting ribs called *beaters* on its outer surface, parallel to its axis. This drum receives a very rapid motion on its axis. The sheaves of corn are first spread out on a slanting table, and are then drawn in with the ears foremost between two feeding rollers with parallel grooves. The beaters of the drum act on the straw as it passes through the rollers, and beat out the grain. The thrashed straw is then carried forward to two successive drums or *shakers*, which, being armed with numerous spikes, lift up and shake the straw so as to free it entirely from the loose grain lodged in it. The grain is made to pass through a grated floor, and is generally conducted to a winnowing-machine connected by gearing with the thrashing-machine itself, by which means the grain is separated from the chaff. Improved machines on the same principle, many of them portable, are extensively used in England and America, those of the latter country being in particular very light and effective. The portable steam thrashing-machine now common in England and in many parts of Scotland has no feeding-rollers, the corn being fed direct to the first drum, which revolves at a very high speed and separates the grain by rubbing against a grating fitted around the drum rather than by direct beating. It gets through far more work than the ordinary stationary mill. With a portable engine the machine can be moved from field to field, and also from farm to farm, thus being capable of performing the thrashing-work of a wide district for the whole season. The owner, by hiring it out, can therefore soon recoup himself for the high price of this machine as compared with the fixed mill.

The name *Thor*, Icel. *Thórr*, the Scandinavian god of thunder, is simply a form of this word.] 1. The sound which follows a flash of lightning; a report due to the sudden disturbance of the air produced by a violent discharge of atmospheric electricity or lightning. The character of the sound varies with the force and the distance of the discharge and the nature of the surrounding country, and is no doubt affected by the relative positions of the clouds. A person in the immediate neighbourhood of a flash of lightning hears only one sharp report, the sharpness being greatly intensified when an object is struck by it. A person at a distance hears the same report as a prolonged peal, and persons in situations at some distance apart hear it each in a different way. These differences have not yet been satisfactorily accounted for; the long rolling effect may be due to echoes from the clouds, and partly perhaps to there being a number of partial discharges from the same cloud at different distances from the observer. As sound travels at the rate of 1100 feet per second, while the passage of light is almost instantaneous, the distance of the observer from the discharge may be approximately estimated by dividing the interval in seconds between the flash and the report by 5 or 4.8, the product being the distance in miles to the place of discharge. Thunder has never been heard 20 miles from the flash. 2. The destructive agent in a thunder-storm; a discharge of lightning; a thunderbolt.

**Thunderbolt** (thun'dér-bólt), *n.* 1. A shaft of lightning; a brilliant stream of electricity passing from one part of the heavens to another, and particularly from the clouds to the earth. The name originated in the ancient notion that the destructive effects of lightning could be caused only by a shaft or bolt-like hard body being hurled at the object destroyed. The terms *thunderbolt* and *thunderstone* were hence frequently applied to certain concrete substances found in the earth which superstition credited with such dreadful effects. (See *THUNDERSTONE*.) In *Aer*, the thunderbolt is repre-

sented as a twisted bar in pale, inflamed at each end, surmounting two jagged darts in saltire, between two wings expanded, with streams of fire issuing from the centre.—2. *Fig.* a daring or irresistible hero.

The daphnes are valued for their fragrance; the various species of the Australian genus *Pimelea*, and the *Gnidias* and *Struthiolas* of the Cape of Good Hope, are favourite objects of cultivation. The most remarkable property of the order is the causticity which resides in the bark. When applied to the skin it acts as a blister; and when chewed it produces pain in the mouth. 2. The alternate rising and falling of the waters of the ocean, and of bays, rivers, &c., connected therewith. The tide appears as a general wave of water, which gradually elevates itself to a certain height, then as gradually sinks till its surface is about as much below the medium level as it was before above it. From that time the wave

again begins to rise; and this reciprocating motion of the waters continues constantly, with certain variations in the height and in the times of attaining the greatest degree of height and of depression. The alternate rising and falling of the tide-wave are observed to take place generally twice in the course of a lunar day, or of 24h. 49m. of mean solar time, on most of the shores of the ocean, and in the greater part of the bays, firths, and rivers which communicate freely with it. The tides form what are called a *flood* and an *ebb*, a *high* and *low water*. The whole interval between high and low water is often called a *tid*; the water is said to *flow* and to *ebb*; and the rising is called the *flood-tide*, and the falling the *ebb-tide*. The rise or fall of the waters, in regard to elevation or depression, is exceedingly different at different places, and is also variable everywhere. The interval between two succeeding high-waters is also variable. It is shortest about new and full moon, being then about 12h. 19m.; and about the time of the moon's quadratures it is 12h. 30m. But these intervals are somewhat different at different places. The chief cause of the tides is the attraction of the moon, which, affecting most strongly the side of the earth nearest to it, draws or heaves up the waters in the parts of the earth successively turned towards it. At the same time the moon attracts the bulk of the earth, and, as it were, pulls the earth away from the water on the surface farthest from it; so that here also the water is raised, although not quite so much as on the nearer side. The waters being thus heaped up at the same time in these two opposite parts of the earth, and the waters situated half-way between them being thus necessarily depressed, two *high* and two *low tides* occur in the period of a little more than one revolution of the earth on its axis. The accompanying cut gives a theoretical view of the effect of the moon's attraction. On the tidal wave caused by the

moon must be superposed that caused by the attraction of the sun, a wave of far inferior volume. When the sun and moon are in conjunction or opposition, at times of new and full moon, their tidal waves will be superposed crest upon crest, and the effect will be what is called a *spring-tide*; when they are in quadrature the lunar tide will be partially neutralized by the solar tide, and the result is a *neap-tide*. (See also *TIDE-WAVE*.) The above explanation assumes that the earth is spherical and uniformly covered with water, and the corrections to be made in consequence of the inaccuracy of these assumptions have occupied the attention of scientists since the time of Newton. The tides being of great importance to all commercial nations, it becomes an object of great importance to obtain the means of predicting them; but the subject, in a general point of view, is attended with many difficulties, and each place requires to have its own tide-tables. See *Establishment of the port* under *ESTABLISHMENT*.—*Acceleration and retardation of the tides*. See under *ACCELERATION*.—*Atmospheric tides*. See under *ATMOSPHERIC*.—*Lee tide*, a tide running in the same direction with the wind.—*Weather tide*, a tide running to windward.—3. A state of being at the height or in superabundance.

No one doubts that *tidology* (as Dr. Whewell proposes to call it) is really a science. As much of the phenomena as depends on the attraction of the sun and moon is completely understood, and may in any even unknown part of the earth's surface, be foretold with certainty; and the far greater part of the phenomena depends on those causes. But circumstances of a local or casual nature, such as the configuration of the bottom of the ocean, the degree of confinement from shores, the direction of the wind, &c., influence, in many or in all places, the height and time of the tide.

J. S. Mill.

Bengal Tiger (*Felis tigris*).

the genus *Felis*, *F. tigris* (sometimes classified as *Tigris regalis*), family *Felidae*. The tiger is about the height of the lion, but the body is longer, and the head rounder. It is of a lively fawn colour above, a pure white below, irregularly crossed with black stripes. It is clothed with short hairs, and has no mane. White or albino varieties have been occasionally met with, a specimen having been shown in this country in 1830. The tiger attains his full development in India, the name of Bengal tiger being used as synonymous with those specimens which appear as the most typical and most powerful representatives of the species. The animal is also found in Java and Sumatra, and no traces of it are found beyond Southern Asia. In habits the tiger is far more active and agile than the lion, and exhibits a large amount of fierce cunning. He generally pitches upon a concealed spot near a water course as a habitat, and springs upon the animals that approach to drink, slinking back to his lair as if discomfited and ashamed should his first bound be unsuccessful. His tread through the thick jungle is noiseless and stealthy, and he appears to avoid rather than court danger, unless when brought to bay, when he turns an appalling fierce front to the foe. These animals do not generally readily attack man himself, but in some cases they seem to acquire a special liking for human prey, and boldly approach villages for the purpose of securing it; such being known as 'man-eaters.' The natives destroy them by traps, pits, poisoned arrows, and other means. Tiger hunting is a favourite Indian sport. It is pursued generally by Europeans, the tiger being shot from the back of an elephant. When taken young the tiger can be tamed, and tigers thus domesticated are not rarely to be seen in India. The name American tiger is frequently applied to the jaguar (*Felis onca*). (See **JAGUAR**.) Hence—2. A person of a fierce, bloodthirsty disposition.—3. G. zimbar*, wood, edifice; *Mod. G. zimner*, an apartment, *zimmerholz* (lit. timber-wood), timber, *zimmermann*, a carpenter. The oldest meaning seems to have been structure, edifice, as in *O. Sax. timbar*, *O. Fris. timber*, an edifice, and as seen in the different verbs; *A. Sax. timbrian*, *Goth. timrjan*, Icel. *timbra*, Dan. *tømre*, *G. zimnern*, to build. The root is that of *Gr. demô*, to build, *domos*, *L. domus*, a house (whence *domestic*, *domicelle*, &c.). Timber therefore means literally building materials.] 1. Trees cut down, squared, or capable of being squared into beams, rafters, boards, planks, &c., for being employed in house or ship building, or in carpentry, joinery, &c. A load of rough or unhewn timber is 40 cubic feet, and a load of squared timber 50 cubic feet, reckoned to weigh 20 cwt. In regard to planks, deals, &c., the load consists of so many square feet; thus a load of 1 inch plank is 600 square feet; a load of plank more than 1 inch thick equals 600 square feet divided by the thickness in inches. This peculiar quality in musical sounds is caused by the mingling of a series of secondary tones with the primary one; as, when the string of a pianoforte is struck, the string, whilst vibrating as a whole, is at the same time divided and again subdivided into aliquot vibrating segments, which, as it were, ride on the back of the principal vibration. The character and number of these secondary tones coexisting with the principal note is the cause of the *timbre* or quality of sound peculiar to different instruments.

Probably of same stem as *tide*, and the root may be *da*, as in Skr. *dā*, to cut, to divide (the *d* becoming *t* in accordance with Grimm's law), in which case *time* might be compared with *L. tempus*, so far as similarity of ideas is concerned, supposing the latter to be from root *tem*, to cut.] 1. The general idea of successive existence; the measure of duration. Time is *absolute* or *relative*; *absolute time* is considered without any relation to bodies or their motions. It is conceived by us as unbounded, continuous, homogeneous, unchangeable in the order of its parts, and divisible without end. *Relative time* is the sensible measure of any portion of duration, often marked by particular phenomena, as the apparent revolution of the celestial bodies, more especially of the sun, or the rotation of the earth on its axis. Time is divided into years, months, weeks, days, hours, minutes, and seconds; but of these portions the years and days only are marked by celestial phenomena. In order to measure time we employ some equable motion, and we judge those times to be equal which pass while a moving body proceeding with a uniform motion passes over equal spaces. The instruments employed for measuring time are clocks, chronometers, clepydras, hour-glasses, and dials; but the three first are those chiefly used. Time is often poetically personified as masculine. 'The plain bald pate of father Time himself.' *Shak.*

Why grieve that Time has brought so soon  
The sober age of manhood on?  
As idly should I weep at noon  
To see the blush of morning gone. *Bryant.*

&c. *Heb. i. 1.*

3. A proper time; a season proper or appropriated to something; hence, opportunity.

After-wits are dearly bought. *Southwell.*

4. An age; a part of duration distinct from other parts; the period at which any definite event occurred or person lived; as, the time of Elizabeth.

9. Leisure; sufficient time; convenience of time; as, I have not time to speak with you now.

Daniel . . . desired of the king that he would give him time. *Dan. ii. 26.*

I have resolved to take time, and in spite of all misfortunes, to write you, at intervals, a long letter. *Swift.*

ness. It is more tenacious than lead, and very flexible, and when bent in the fingers it emits a peculiar crackling sound. Its specific gravity is 7.29. It melts at 442°, and if heated to whiteness in air it takes fire and burns with a white flame, forming peroxide of tin. Tin is rather a scarce metal, being found in few places of the world in any quantity. The mines in Cornwall are its most productive source; it also occurs in Bohemia, Saxony, and Spain; in the islands of Banca and Billiton, and the Straits Settlements, in Asia; in Mexico, Chili, Peru, and Massachusetts, in America; and in Australia. There are only two ores of tin: the native binoxide, called *tin-stone*, and the double sulphide of tin and copper, called *tin pyrites*. The binoxide of tin, called also *cassiterite*, is the only ore found in sufficient quantities to make it the object of mineral explorations. It occurs in Cornwall in two forms: (1) in veins where it is blended with several other metals, as arsenic, copper, zinc, and tungsten; (2) in loose rounded masses, grains, or sand in alluvial soil, in which state it is called *stream-tin*. The former, when reduced to the metallic state, yields block-tin, while the latter yields grain-tin, which is the purer of the two. What is termed wood-tin is found in reniform and botryoidal masses, or in wedge-shaped pieces. Tin pyrites, the other ore of tin, occurs massive, with a granular composition; fracture uneven, imperfectly conchoidal; lustre metallic; colour steel-gray, inclining to yellow; hardness about that of fluor-spar. It contains from 14 to 30 per cent of tin. The Phœnicians, long before the Christian era, fetched this metal, under the name of *kassiteros*, from the British islands, which were thence called *Cassiterides*, or islands of tin. Oxygen combines with tin, forming protoxide of tin or stannous oxide ( $\text{SnO}$ ), sesquioxide ( $\text{Sn}_2\text{O}_3$ ), and dioxide or stannic oxide ( $\text{SnO}_2$ ). The compounds of chlorine with tin are dichloride or stannous chloride ( $\text{SnCl}_2$ ), sesquichloride or stannous-stannic chloride ( $\text{Sn}_2\text{Cl}_3$ ), and tetrachloride or stannic chloride ( $\text{SnCl}_4$ ); and of sulphur with it, the protosulphide or stannous sulphide ( $\text{SnS}$ ), sesquisulphide ( $\text{Sn}_2\text{S}_3$ ), and the disulphide or stannic sulphide ( $\text{SnS}_2$ ). The uses of tin are numerous. It is much used as a covering to several other metals, as in tin-plate and cooking vessels of copper. Combined with copper it forms bronze, bell-metal, and several other useful alloys. With lead it forms pewter, and solder of various kinds. Tin-foil coated with mercury forms the reflecting surface of glass-mirrors. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids are much used in dyeing. 2. Thin plates of iron covered with tin. See TIN-PLATE. — 3. A cant name for money. *Lord Lytton; Disraeli.* [Low.]

2. In animal anat. the texture or grouping of anatomical elements of which the systems of organs are composed; the primary layers composing any of the parts of animal bodies. The classification of tissues may now be said to be arranged on two different principles, having reference either to special histology, which concerns itself with the structure of organs in which a combination of various tissues may enter; or to general histology, which treats of the tissues properly so called. Hence, under the first arrangement we speak of *muscular tissue*, or *flesh*; *osseous tissue*, or *bone*; *adipose tissue*, or *fat*; *cartilaginous tissue*, or *gristle*; *pigmentary tissue*, or colouring matter seen in the skin, in the choroid coat of the eye, the iris, &c.; *areolar, cellular, or connective tissue*, widely distributed in every part of the body, and serving to bind together and consolidate other parts and tissues. According to the second system of grouping we have, (a) *cellular tissue*, which consists entirely of cells, in which cell lies close to cell, such as occur in the epidermis, nails, the epithelium, or living membranes of the inner surfaces of the body, &c.; (b) *connective tissue*, in which one cell is regularly separated from the others by a certain amount of intermediate or intercellular substance, as exemplified in cartilage, fat, &c.; (c) more highly developed tissues in which the structures are usually more or less tubular; this group including the muscles, nerves, and vessels, and, in Virchow's arrangement, the blood. It is to be observed that though the terms in the two classifications may have a correspondence in name, the correspondence does not extend strictly to the nature of the tissues to which they are applied. The terms *adventitious, accidental, or pathological tissue* have been applied generally to morbid productions resembling any of the natural or physiological tissues. The belief is gaining currency that every pathological tissue has its physiological or normal prototype, and that the abnormality consists either in its production at the wrong place or time, or to an excessive extent.

3. In vegetable anat. the minute elementary structures of which the organs of plants are composed. These elementary structures differ from each other, and are so minute as generally to be distinctly visible only with the aid of the microscope. They are named *elementary organs, organic tissue*, or

**vegetable tissue.** When a leaf or a portion of the stem of one of the higher plants is submitted to the microscope it is found to consist, (1) of a thin transparent homogeneous membrane, which is arranged in the form of cells or cylindrical tubes; (2) of fibres which are arranged in a spiral form in the interior of the cells or tubes; and (3) of a fluid, filling the cells, and existing between them, and containing in it globules of various sizes and kinds. These parts constitute what are known respectively as elementary membrane, elementary fibre, and organic mucus. The elementary fibre is only found in the higher forms of plants, the other two are found in all plants. The tissues of plants then are composed of elementary membrane and elementary fibre, and the principal forms under which they

exhibit themselves constitute the cellular tissue, fibrous tissue, and vascular tissue. **Cellular tissue**, often called **parenchyma**, is composed of membrane in the form of cells or cavities which are closed on all sides, and are commonly of aspherical form, although they often assume various other forms. The pith of plants is entirely composed of cellular tissue, but it enters largely into the structure of other parts, and in many, as in the mushroom and sea-weed orders, is the only tissue. **Fibrous tissue** is that in which the elementary fibre alone is apparent. When the cells are composed of membrane and spiral fibre combined, or of fibre alone (as in some instance when the membrane appears to have been absorbed during growth), they constitute the **fibro-cellular tissue**. **Vascular or tubular tissue** is composed of very elongated membranous tubes, tapering at each end. It comprehends the woody (also called **prosenchyma**) and laticiferous tissues. When the tubes have within them a spiral fibre, or their walls marked with broken spiral lines or dots, arranged in a circular or spiral direction, they constitute **fibro-vascular tissue**.—4. A connected series; as, the whole story is a **tissue** of forgeries or of falsehood.

**Titania** (ti-tä'ni-a), n. The queen of Fairyland and consort of Oberon.

The Shakespearean commentators have not thought fit to inform us why the poet designates the Fairy-queen *Titania*. It, however, presents no difficulty. The fairy-queen was therefore the same as Diana, whom Ovid (*Met.* iii. 173) styles *Titania*. *Keightley.*

**Titanium** (ti-tä'ni-um), n. [So called in fanciful allusion to the *Titans*. See **TITAN**.] *Sym. Ti.* At. wt. 50. A metal discovered by Gregor in 1791, in a black sand in Cornwall. It was afterwards discovered by Klaproth in some other minerals, and he gave it the name it now bears. In 1825 Wollaston examined it, and ascertained its properties. It is found combined with oxygen in several minerals, and occurs occasionally in combination with nitrogen in the slag ironworks as small cubical crystals, exactly similar to bright copper in appearance, of specific gravity 5.3, and very infusible. When heated with nitre these crystals are oxidized, producing titanic acid. Titanium is a dark green, heavy, amorphous powder. Oxygen and titanium combine, forming the sesquioxide Ti<sub>2</sub>O<sub>3</sub>, which is a black powder, and the peroxide or titanic acid, TiO<sub>2</sub>. Titanium also combines with chlorine, forming two chlorides, TiCl<sub>3</sub> and TiCl<sub>4</sub>, and with sulphur forming a sulphide, TiS<sub>2</sub>. This metal forms several compounds with nitrogen. The ores of this metal are called **menachanite**, from Menachan in Cornwall, where it was originally found; **iserine**, from the river Iser, in Silesia; **nigrine**, from its black colour; **sphene**, rutile, brookite, axotomous iron, crichtonite, ilmenite, molsite, æschynite, greenovite, and octahedrite or anatase.—**Titanium green**, ferrocyanide of titanium, precipitated by ferrocyanide of potassium from a solution of titanic chloride, recommended as an innocuous substitute for Schweinfurt-green and other arsenical green pigments. In England tithes are *personal*, *predial*, or *mixed*; *personal*, when accruing from labour, art, trade, and navigation; *predial*, when issuing from the earth, as hay, wood, grain, and fruit; and *mixed*, when accruing from beasts which are fed from the ground. Another division of tithes is into *great* and *small*. *Great tithes* consist of all species of corn and grain, hay, and wood; and *small tithes*, of predial tithes of other kinds, together with mixed and personal tithes. The great tithes belong to the rector, and are hence called *parsonage tithes*; and the latter are due to the vicar, and are hence called *vicarage tithes*. Tithes are either due de jure or by custom; to the latter class belong all personal tithes. The exemptions from tithes are composition, a modus decimandi, prescription, or act of parliament.—**Commutation of tithes**, the conversion of tithes into a rent-charge payable in money, and chargeable on the land. Several acts of parliament have been passed for effecting the commutation of tithes in England and Ireland. In regard to tithes in Scotland see **TEINIS**.—2. A small part or proportion.

An appellation of dignity, distinction, or pre-eminence given to persons.—*Titles of honour* are words and phrases which belong to certain persons as their right in consequence of certain dignities being inherent in them or conferred upon them, as Emperor, King, Czar, Prince, &c. The five orders of nobility in Britain are distinguished by the titles of honour—Duke, Marquess, Earl, Viscount, and Baron; and the persons in whom the dignity of the peerage inheres are entitled to be designated by these words. The dignity of Baronet has, besides its name, which is placed after the name and surname of the person spoken of, the privilege of prefixing Sir. This title, like the titles of peers, is hereditary. The dignity of knighthood, which is not hereditary, entitles those on whom the honour is conferred to the prefix Sir to their former name and surname. Ecclesiastical dignities, such as Archbishop, Bishop, &c., bring with them the right to certain titles of honour besides the phrases by which the dignity itself is designated; and it is usual to bestow on all persons who are admitted into the clerical order the title of Reverend. Municipal offices have

also titles accompanying them, as the Right Honourable the Lord Mayor, the Right Honourable the Lord Provost, the Lord Dean of Guild, &c.; and in the law there are very eminent offices the names of which become titles of honour to the possessors of them, and which bring with them the right to certain terms of distinction.

Stamped tokens of lead, tin, and even leather were issued by vintners, grocers, and other tradesmen during the time of Elizabeth, and were extensively circulated, being readily exchanged for authorized money at the shops where they were issued. Tokens were at one time struck by the corporations of Bristol, Oxford, and Worcester. A currency of this kind (mostly of copper) was much used during the close of last century; and previous to 1817, when there was a scarcity of government silver money, the Bank of England issued silver pieces called bank tokens of the values of 6s., 3s., and 1s. 6d. On the revision of the coinage at that date tokens were abolished.—7. In *printing*, ten quires of paper; an extra quire is usually added to every other token when counted out for the press. *Toleration* is of two kinds; the allowing to dissenters the unmolested profession and exercise of their religion, but with an exclusion from offices of trust and emolument in the state, which is a partial *toleration*; and the admitting them without distinction to all the civil privileges and capacities of other citizens, which is a complete *toleration*. *Paley.*

So natural to mankind is intolerance in whatever they really care about, that in the minds of almost all religious persons, even in the most tolerant countries, the duty of *toleration* is admitted with tacit reserves. One person will bear with dissent in matters of Church government, but not of dogma; another can tolerate anybody short of a Papist or a Unitarian; another, every one who believes in revealed religion; a few extend their charity a little further, but stop at the belief in a God and in a future state. Wherever the sentiment of the majority is still genuine and intense, it is found to have abated little of its claim to be obeyed. *J. S. Mill.*

3. A disposition to tolerate or not to judge or deal harshly or rigorously in cases of differences of opinion, conduct, or the like; tolerance.—*Act of Toleration*, the name given to the statute 1 Will. and Mary, xviii. by which Protestant dissenters from the Church of England, on condition of taking the oaths of supremacy and allegiance and repudiating the doctrine of transubstantiation, were relieved from the restrictions under which they had formerly lain with regard to the exercise of their religion according to their own forms. This act has been frequently amended and extended, and several other acts in the direction of toleration have been subsequently passed, so that now dissenters, Roman Catholics, and Jews alike enjoy all the privileges of the constitution.

See **THIN**, **TESS**.] 1. Any sound considered with relation to (a) its acuteness or gravity=pitch; (b) its openness, dulness, purity, sweetness, harshness, or the like=quality or timbre; (c) its

3. An affected or whining style of intonation in speaking or reading; a mournful or artificial mode of utterance; a sing-song or measured rhythmical manner of speaking; a drawl; a whine.

We ought certainly to read blank verse so as to make every line sensible to the ear; at the same time, in doing so, every appearance of sing-song and tone must be carefully guarded against. *Dr. Blair*.

4. In music, (a) the impression on the ear made by the undulations of the atmosphere, &c., produced by the vibration of a string or other sonorous body; a musical sound. Nearly every musical sound is composite, that is, consists of several simultaneous tones having different rates of vibration according to fixed laws, which depend on the nature of the sonorous body and the mode of producing its vibrations. The simultaneously sounding components are called *partial tones*; that one having the lowest rate of vibration and the loudest sound is termed the *prime*, *principal*, or *fundamental tone*; the other partial tones are called *harmonics* or *overtones*. Thus a single string produces not only its own prime or fundamental tone, but also its octave, twelfth, fifteenth (double octave), seventeenth, nineteenth, &c., of

sounds belonging to  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ ,  $\frac{1}{6}$ , &c., of its length. Put in somewhat different and simpler words, the fundamental tone may be said to generate the other two tones of the major triad or common chord; that is, the third and the fifth, or their octaves, itself being the tonic or key-note. The quality of any sound (=timbre) is due partly to the presence or absence of overtones or harmonics in this series, and partly to the greater or less intensity of those present as compared with the fundamental tone and with one another; sounds composed of the above six elementary tones being rich and sweet. Under certain conditions it is found that two notes when sounded together produce by their combination other notes, which are not found as constituents of either; these are called *resultant tones*, and are of two kinds: *difference tones* and *summation tones*.

A difference tone has a frequency of vibration which is the difference of the frequencies of its components; a summation tone has a frequency of vibration which is the sum of the frequencies of its components. As the components may either be fundamental tones or overtones, two notes which are rich in harmonics yield by their combination a large number of resultant tones. The difference tones were observed in the last century by Tartini, and have been therefore called *Tartini tones*. (b) One of the larger intervals between certain contiguous notes of the diatonic scale; as, the *major tones*, or intervals of 9 commas between C-D, F-G, and A-B; the *minor tones*, or intervals of 8 commas between D-E and G-A. The smaller intervals of 5 commas between E-F and B-C are called *semitones*. The terms *tone* and *semitone* are also applied to the artificial intervals adopted in the temperament of fixed-toned instruments. (See **TEMPERAMENT**.) (c) The peculiar quality of sound of any voice or instrument: timbre; as, a mellow or rich tone; a poor or thin tone; a reedy tone. [Note. The regrettable use of the word *tone* both for a sound, and for the interval between two sounds or tones, is confusing, but has been hitherto common, indeed almost universal, among musicians of the highest standing.]—5. That state of a body in which the animal functions are healthy and performed with due vigour; the state in which all the parts and organs have due tension or are well-strung; the strength and activity of the organs, from which proceed healthy functions.—6. **Tonic** (ton'ik), *n.* 1. In med. any remedy which improves the tone or vigour of the fibres of the stomach and bowels, or of the muscular fibres generally. Tonics may be said to be of two kinds, medical and non-medical. Medical tonics act chiefly in two ways; as, (a) indirectly, by first influencing the stomach and increasing its digestive powers; such being the effect of the vegetable bitters, the most important of which are calumba, chamomile, cinchona bark, gentian, salix, taraxacum, &c. (b) Directly, by passing into and exerting their influence through the blood; such being the case with the various preparations of iron, certain mineral acids, and salts. The non-medical tonics are open-air exercise, friction, cold in its various forms and applications, as the shower-bath, sea-bathing, &c. — 2. In music, the key-note or fundamental note of a scale. See **KEY-NOTE**.

**Tonicity** (to-ni'si-ti), *n.* In *physiol.* the elasticity of living parts; a property of the muscles distinct from the true irritability, and which determines the general tone of the solids. **Tonic Sol-fa** (ton'ik sol-fa). A term applied to a system of writing and teaching music,

ch, chain; ch, Se. loch; g, go; j, job;

h, Fr. ton; ng, sing; TH, then; th, thin;

w, wig; wh, whig; zh, azure. — See **KEY**.

the leading features of which are as follows: As of the two relations of musical sounds, those of pitch and key, the latter is of transcendent importance, every means should be taken to impress this fact on the mind and ear of the learner. Any diatonic scale is a natural scale, whether it is founded on the key of C, D, E, or on any other tone thus represented by a letter-name in the ordinary notation. The tonic or key-note of the scale is always called *doh*, the second *ray*, the others *me, fah, soh, lah, te*, successively, no matter what the absolute pitch of the sound may be, the initials only being ordinarily used in printed music: thus, *d, r, m, f, s, l, t*. To designate a sound of absolute pitch, the tonic-solfaist uses the first seven letters of the alphabet just as the followers of the other musical system do. Time and accent are marked thus, | : |, or | : : |, or | : : : |, &c.; the space between the lines and dots indicating the aliquot parts of the bar (the beat or pulse), the line showing the strong accent, the short line the medium accent, and the colon the weak accent. Accidental or chromatic tones are indicated by a change in the vowel sounds of the syllables; thus, *doh, ray, fah*, &c., when sharpened become *de, re, fe*, &c.; and *me, te*, &c., flattened become *ma, ta*, &c. The higher octaves are marked *d', r', m', &c.*, the lower *d, r, m, &c.* The last two lines of the psalm tune *French* would therefore be printed thus:—

Key F. : s | d' : t | l : s | s : fe | s : m | r : d | d : t, | d.

In teaching the system great use is made of the modulator, a chart which represents pictorially in an upright position the relative places of the notes of the scales, the chromatic notes, the closely related scales, &c.

**Tonnage** (ton'aj), *n.* [From *ton*.] 1. The weight of goods carried in a boat or ship.—2. The cubical content or burden of a ship in tons; the number of tons a ship can

carry with safety; the gauge of a vessel's dimensions, estimated by various modes of measurement legalized in different countries. It is generally assumed that 40 cubic feet shall constitute a ton, and the tonnage of a ship is considered to be the multiple of this ton which most closely corresponds with the internal capacity of the vessel. In this country the usual mode formerly was to multiply the length of the ship by the breadth, assume the depth to be the same as the width, multiply by this assumed depth, and divide the product by 94, the quotient being the tons burden. But this mode was found to be both misleading and dangerous; for as harbour and light dues, towage, &c., were charged according to tonnage, shipowners had their vessels built so deep and narrow that they were often unseaworthy. An improved system was, therefore, introduced and made compulsory by the Merchant Shipping Act of 1854. The elaborate instructions of this statute take into account not only the depth of the vessel, but also make allowance for the varying curvature of the hull. The depth from the deck to the bottom of the hold is taken at different places, and the breadth is measured at different elevations in the depth. If the vessel is a steamer, an allowance is made for the space occupied by the engine-room, boilers, coal-bunks, &c. In vessels with a break or poop in the upper deck, the tonnage of this poop space must be ascertained and added to the ordinary tonnage.—3. A duty or impost on ships, formerly estimated at so much per ton of freight, but now proportioned to the registered size of the vessels.—4. Same origin as *turn*.] A violent whirling wind, or a tempest; more especially applied to those whirlwind hurricanes prevalent in the West Indies and on the western coast of Africa about the time of the equinoxes, and in the Indian Ocean about the changes of the monsoons. It is, however, frequently applied to any tempest or hurricane, and in this sense may be looked upon as signifying, in reference to the localities above named, what *typhoon* means in the seas of China and the Eastern Archipelago. Tornadoes are usually accompanied with severe thunder, lightning, and torrents of rain; but they are of short duration and limited in area.

**Tornatellidae** (tor-na-tel'i-dé), *n. pl.* [L. *torantus*, turned in a lathe.] A family of molluscs belonging to the tectibranchiate section of the order Opisthobranchiata, and distinguished from all the other members of the order by their regularly spiral external shell. when irritated. The family is distinguished by the body being rounded in front, the back being also round and destitute of scales. The tail fin is three-cornered in shape, and the teeth are pointed; the edges of the spiracles or breathing apertures are serrated. The torpedoes occur in typical perfection

in the Mediterranean (including the common torpedo or *Torpedo vulgaris*, and *T. narke*) and in the Indian and Pacific Oceans, stray specimens being now and again found on the British coasts. The fish may sometimes measure 4 feet long, and weigh from 60 to 70 lbs. It owes its remarkable electric power to two special organs, which consist of two masses placed on each side of the head, and consisting each of numerous vertical gelatinous columns, separated by membranous septa, and richly furnished with nervous filaments derived from the nervi vagi, or eighth pair of nerves, the entire apparatus presenting a resemblance to the voltaic battery. The production of electricity by these fishes is readily enough explicable, on the ground of the conversion of an equivalent of nerve force into electric force through the medium of the electric organ; just as, under other circumstances, nerve force is converted into motion through the muscles. The power of the discharge varies with the health and size of the fish; but there is little doubt of the exceedingly potent nature of the apparatus, especially under excitement. The numbing power of the torpedo was well known to the Greeks and Romans. It also receives the names of *Cramp-fish* and *Numbing-fish*.

The torpedo, or cramp-fish, came to hand; a fish, if Pliny writes truth, that by hiding itself with mud and dirt catches lesser fish very strangely; for, by his frigidity he benumbs such fish as swim over or lodge near him, and so preys upon them.

Sir T. Herbert.

2. A term applied to two distinct classes of submarine destructive agents used in war, namely, torpedoes proper, which are propelled against an enemy's ship; and more or less stationary chambers or mines, placed where a hostile vessel would be likely to come in contact with them. Of the first class, called also *offensive torpedoes*, there are three principal types: (a) the 'locomotive,' of which the Whitehead is the best known form; (b) the 'towing' torpedo of Captain Harvey; and (c) the 'spar' or 'outrigger' torpedo. The Whitehead, or fish torpedo, may be described as being a cigar-shaped vessel, varying from 14 to 19 feet in length, and from 14 to 16 inches in diameter. It is

Whitehead Torpedo.

made of specially prepared steel, and is divided into three compartments; the head contains the gun-cotton which forms its charge and the fuse for exploding it when it comes in contact with a vessel. The central part contains the engines by which it is propelled, and which are worked by compressed air, a sufficient supply of which for driving the torpedo the required distance is stored in the third, or tail compartment. The propeller is a three-bladed screw, which can move the largest sized torpedoes at a speed of 24 knots for the distance of 220 yards, the distance of 1000 yards being reached at a slower rate of progress. By means of a horizontal balance rudder it can be made to sink and to remain during its run at any required distance below the surface of the water, so that it may be discharged from the deck of a ship or from a tube opening into the sea below the water line. At close quarters this is a very destructive weapon against ironclad vessels, striking them beneath their armour. The Harvey torpedo is constructed to be pulled through the water something in the fashion of a ship's log. It is of such a form as to pull the line out at a considerable angle to the keel of the towing vessel, which endeavours to manoeuvre so as to draw the torpedo under the stern of an enemy, and explode it on contact by a trigger bolt. The spar or outrigger torpedo consists simply of a metal case containing the explosive substance (gunpowder, gun-cotton, dynamite, &c.), and fitted with a fuse constructed so that it can be fired at pleasure, or exploded by contact with a ship's side. It is screwed on to a long spar, which is usually fixed in the bow of a swift boat or steam-launch, which endeavours to reach and push the

torpedo against the hostile vessel. Stationary or defensive torpedoes, such as one placed in channels or coasts to prevent the approach of the enemy's vessels, usually consist of a strong metal case containing an effective explosive, such as gun-cotton, &c., and having a fuse or cap which will explode the charge on the slightest contact; or the explosion may be effected by means of electricity, the operator firing it at will from the shore. — 3. A name sometimes applied to various other explosive agents, such as a shell buried in the path of a storming party, having a percussion or friction device which explodes the charge when the ground over the torpedo is trod on; a fog-signal laid on the metals of a railway and exploded by the wheels of a passing train; a kind of fire-work or toy in the shape of a small ball, which explodes on being dashed against a hard object.

**Torpedo-boat, Torpedo-vessel** (tor-pé'dó-bót, tor-pé'dó-ves-el), *n.* A vessel carrying one or more torpedoes, and exploding them against another vessel. The torpedo-boat is usually a small, swift steamer, lying low in the water, and meant to approach the enemy either by surprise or under the cover of darkness. See TORPEDO, 2.

This experiment consisted in filling with mercury a glass tube closed at one end and then inverting it; the open end was then brought under the surface of mercury in a vessel, when the column of mercury in the tube was observed to descend till it stood at a height equal to about 30 inches above the level of the mercury in the vessel, leaving a vacuum at the top, between the upper extremity of the column and that of the tube. This experiment led to the discovery that the column of mercury in the tube is supported by the pressure of the atmosphere acting on the surface of the mercury in the vessel, and that this column is an exact counterbalance to the atmospheric pressure. See *BAROMETER*.—*Torricellian tube*, a glass tube 30 or more inches in length, open at one end and hermetically sealed at the other, such as is used in the barometer.—*Torricellian vacuum*, a vacuum such as that produced by filling a barometer tube with mercury, as in the Torricellian experiment; the vacuum above the mercurial column in the barometer.

**Torsibility** (tor-si-bil'i-ti), *n.* The tendency to untwist after being twisted; as, the *torsibility* of a fibre or rope. [Rare.]

**Torsion** (tor'shon), *n.* [*L. L. torsio*, from *L. torqueo*, to twist. See *TORTURE*.] 1. The act of twisting; the twisting, wrenching, or straining of a body by the exertion of a lateral force tending to turn one end or part of it about a longitudinal axis, while the other is held fast or twisted in an opposite direction.—2. In *mech.* the force with which a body, such as a thread, wire, or slender rod resists a twist, or the force with which it tends to return to its original state on being twisted. The resistance which cylinders and prisms formed of different substances oppose to torsion, furnishes one of the usual methods of determining the strength of materials. Such machines as capstans and windlasses, also axes which revolve with their wheels, are, when in action, subject to be twisted, or undergo the strain of torsion. If a slender rod of metal be suspended vertically, so as to be rigidly fixed at the point of suspension, and then twisted through a certain angle, it will, when the twisting force ceases to act, untwist itself or return in the opposite direction with a greater or less force or velocity until it come to rest in its original position. The limits of torsion within which the body will return to its original state depend upon its elasticity, and the force with which it tends to recover its natural state is called *elasticity of torsion*. This force is always proportional to the angle through which the body has been twisted. If a body is twisted so as to exceed the limit of its elasticity, its particles will either be wrenched asunder, or it will take a *set*, and will not return to its original position on the withdrawal of the twisting force.—*Torsion balance*, or *balance of torsion*.

If a piece of very fine wire, silk, or spun glass be suspended in the manner above stated, and then twisted, it will, when released, begin to untwist itself, and by the momentum acquired in the act of untwisting will twist in the opposite direction to a greater or less extent, according to the amount of twisting to which it has been subjected. It will then begin to return, and thus by a series of oscillations, continually diminishing in extent, it will at length gradually settle in its original position. Now if a needle or an index be attached to the lower extremity of the suspended wire or thread, and a graduated circle be placed immediately beneath the index in a horizontal position, so that the centre of the circle may be directly below the point of suspension of the index, the apparatus thus constructed will form the *torsion balance*. This balance has been employed to measure certain forces too minute to be estimated by the ordinary methods, and by means of it Coulomb was enabled to determine, by direct experiment, the laws which govern the variation of magnetic and electric forces. By means of the same instrument Cavendish afterward detected and measured the attraction of gravitation existing between balls of lead. To measure small forces, such as those of electricity, magnetism, &c., with the torsion balance, they are made to act upon one extremity of the index, and thus cause it to turn round, and when the force is in equilibrium with the tendency of the suspended wire to untwist, the angle which the index makes with its original position, which is called the *angle of torsion*, and which is measured by the graduated circle, is the measure of the force employed. In making experiments with the torsion balance the length of the suspended wire, its diameter, and the weights attached to its lower extremity must be taken into account. When the balance is adapted to measure electric forces it is called the *torsion electrometer*, when it is adapted to measure galvanic forces it is called the *torsion galvanometer*, and when applied to measure magnetic forces it receives the name of the *torsion magnetometer*.—3. In *surg.* the twisting of the cut end of a small artery in a wound or after an operation, for the purpose of checking hæmorrhage. The bleeding vessel is seized by a forceps, drawn out for about  $\frac{1}{2}$  inch, and then twisted round several times till it cannot untwist itself.

Fr. *tortue*, a tortoise, from *L. torqueo*, *tortum*, to twist, to wrench, to wind (whence *torture*, &c.). The name is given from the twisted appearance of the animal's limbs.] 1. The name which,

Common or Greek Tortoise (*Testudo graeca*).

when standing alone, is now generally restricted to the family of reptiles Testudinidae, or land-tortoises, or with a qualifying term is applied to the Emydæ, the terrapins or freshwater tortoises, and the Trionyxidae, the mud-turtles, or soft tortoises. The name was often formerly applied to all the members of the order Chelonians, which includes the Chelonidae, a salt-water family; but the reptiles of this section are now usually called turtles. (See **TERRAPIN**, **TURTLE**.) The distinctive features of the tortoises and other chelonians consist in the modification of the skeleton and of the skin structures or scales to form the well-known bony box in which their bodies are inclosed. Thus the spinal elements of the back, together with the expanded and united ribs, form the carapace or back, whilst the sides of the box are formed by marginal plates, which by some zoologists are regarded as representing the ossified and modified cartilages of the ribs, and by others as membrane bones developed by the skin. The plastron or lower part of the bony case is formed by nine pieces, as to the nature of which naturalists also disagree, some considering it merely as a greatly modified sternum or breast-bone, and others as composed of membrane bones developed like the marginal plates by the skin. The Testudinidae (the typical land-tortoises) have short stunted limbs adapted for terrestrial progression; the short toes are bound together by the skin, and have well-developed nails. The carapace is strongly convex, and is covered by horny

epidermic plates. The horny jaws are unprotected and adapted for cutting, or may be divided into serrated processes. The head, limbs, and tail can be completely retracted within the carapace. Though capable of swimming, the tortoises proper are really terrestrial animals, and are strictly vegetable feeders. The most familiar example is the common Greek or European tortoise (*Testudo graeca*) so frequently kept as a household pet, and which occurs chiefly on the eastern borders of the Mediterranean. These animals sometimes live to a great age (over 100 years according to some), and hibernate through the colder season of the year. They attain a length of 12 inches. A much larger species is the great Indian tortoise (*T. indica*), which inhabits in great numbers the Seychelles and Galapagos Islands, and attains a length of over 3 feet, and a weight of 200 lbs. Its flesh is reckoned food of excellent quality, as are also its eggs.

The box tortoise of India and Madagascar (*Cinyxia arachnoides*) is remarkable for the curious development of the front part of the plastron which shuts over the anterior aperture of the shell like a lid when the animal retracts itself. The box tortoise of North America (*Cistudo carolina*), in which the hinder part of the plastron forms a lid, is included among the Emydæ or terrapins, as is also the lettered tortoise (*Emys scripta*) belonging to the same continent, and so named from the curious markings of its shell.—2. *Milit.* a defence used by the ancients, formed by the troops arranging themselves in close order and placing their bucklers over their heads, making a cover resembling a tortoise-shell; a *testudo* (which see).

**Tortoise-beetle** (tor'tois-bē-tl or tor'tiz-bē-tl), *n.* A member of an extensive family of coleopterous insects (Cassididae), living upon plants, and so called from their elytra projecting over the body somewhat like the carapace of a tortoise. Many hundred species are known, a few of which are found in this country.

**Tortoise-flower** (tor'tois-flou-ēr or tor'tiz-flou-ēr), *n.* See **CHLONE**.

**Tortoise-plant** (tor'tois-plant or tor'tiz-plant), *n.* The name of a plant (*Testudinaria elephantipes*) closely allied to the yams, and so called from its bulky rhizome or rootstock, which is wholly above ground, and has a coat of a bark-like, corky substance which becomes deeply cracked and formed into large angular protuberances, somewhat resembling the shell of a tortoise. It is a native of the Cape of Good Hope, and is occasionally found in greenhouses in Britain.

**Tortoise-shell** (tor'tois-shel or tor'tiz-shel), *n.* A name popularly applied to the shell or rather the scutes or scales of the tortoise and other allied chelonians, especially to the shell of the *Chelonia imbricata* (the hawk's-bill turtle), a species which inhabits tropical seas. The horny scales or plates which form the covering of this animal are extensively used in the manufacture of combs, snuff-boxes, &c., and in inlaying and other ornamental work. It becomes very plastic when heated, and when cold retains with sharpness any form it may be moulded to in its heated state. Pieces can also be welded together under the pressure of hot irons. The quality of tortoise-shell depends mainly on the thickness and size of the scales, and in a smaller degree upon the clearness and brilliancy of the colours. The

Hawk's-bill or Tortoise-shell Turtle (*Chelonia imbricata*).

best tortoise-shell is that of the Indian Archipelago. It is now largely and successfully imitated by horn, and artificial com-

pounds of much less cost.—*Tortoise-shell butterfly*, a name given by collectors to *Vanessa polychlora* and *V. urtica*.

The nickname, like its contemporaneous opposite *Whig*, in coming into popular use became much less strict in its application, until at last it came simply to signify an adherent of that political party in the state who disapproved of change in the ancient constitution, and who supported the claims and authority of the king, church, and aristocracy, while their opponents, the Whigs, were in favour of more or less radical changes, and supported the claims of the democracy. In modern times the term has to some extent been supplanted by *Conservative*, and the *Conservative* may be considered as the modern representative of the ancient *Tory*. See *CONSERVATIVE*.

It is curious how often political parties have ended by assuming to themselves names first fastened on them by their adversaries in reproach and scorn. *Tories* was a name properly belonging to the Irish bogtrotters, who during our Civil War robbed and plundered, professing to be in arms for the maintenance of the royal cause, and from them transferred about the year 1680, to those who sought to maintain the extreme prerogatives of the Crown. *Trench.*

John Keble, and other Oxford scholars, sought to mark out a middle course between Romanism and what they considered a rationalistic or latitudinarian Protestantism; but as tract after tract appeared it became clearly apparent that they were pervaded by a spirit unmistakably hostile to Protestantism and favourable to Roman Catholicism. The writers openly showed that they were entirely out of sympathy with the Reformers of the sixteenth century, and boldly taught the doctrines of priestly absolutism, the real presence, the paramount authority of the church, and the value of tradition; that there was no insurmountable barrier between the Roman Catholic and the Anglican communions; and that the Thirty-nine Articles, though drawn up by Protestants, are susceptible of a Catholic interpretation not inconsistent with the doctrines of the Council of Trent. Many who favoured this Anglo-Catholic movement subsequently went over to the Church of Rome, while others remained to form the representatives of the extremely ritualistic or High Church section of the Church of England.

As accessories these unions may collect funds for benefit societies, insurance of tools, libraries, and reading-rooms; but their fund, to which every member must regularly contribute a stated sum, is principally reserved for enabling the men to resist, by strikes and otherwise, such action on the part of the employers as would tend to lower the rate of wages or lengthen the hours of labour.

**Trade-wind** (trād'wind), *n.* [That is, wind blowing in a regular trade or course.] One of those perpetual or constant winds which occur in all open seas on both sides of the equator, and to the distance of about 30° north and south of it. On the north of the equator their direction is from the north-east (varying at times a point or two of the compass either way); on the south of the equator they proceed from the south-east. The origin of the trade-winds is this:—The great heat of the torrid zone rarefies and makes lighter the air of that region, and in consequence of this rarefaction the air rises and ascends into the higher regions of the atmosphere. To supply its place colder air from the northern and southern regions rushes towards the equator, which, also becoming rarefied, ascends in its turn. The heated air which thus ascends into the upper regions of the atmosphere being there condensed flows northward and southward to supply the deficiency caused by the undercurrents blowing towards the equator. These undercurrents coming from the north and south are, in consequence of the earth's rotation on its axis, deflected from their course as they approach the equatorial region, and thus become north-east and south-east winds, constituting the trade-winds. The belt between the two trade-winds is characterized by calms, frequently interrupted, however, by violent storms. The position of the sun has an influence on the strength and direction of the trade-winds, for when the sun is near the tropic of Cancer the south-east wind becomes gradually more southerly and stronger and the north-east weaker and more easterly. The effect is reversed when the sun approaches towards the tropic of Capricorn. Trade-winds are constant only over the open ocean, and the larger the expanse of ocean over which they blow (as in the Pacific) the more steady they are. When these winds blow over land they are obstructed and their direction changed by coming in contact with high land or mountains. In some places the trade-winds become periodical, blowing one half of the year in one direction and the other half in the opposite direction. See MONSOON.

A dramatic poem, representing an important event or a series of events in the life of some person or persons, in which the action is elevated and the catastrophe melancholy; that kind of drama which represents a tragical situation or a tragical character. A Greek tragedy always consisted of two distinct parts: the dialogue, which corresponded in its general features to the dramatic compositions of modern times; and the chorus, the whole tone of which was lyrical rather than dramatic, and which was meant to be sung, while the dialogue was intended to be recited. The unity of time; namely, that the duration of the action should not exceed twenty-four hours; and that of place, namely, that the scene in which the events occur should be the same throughout, are modern inventions.

[Note. By some zoologists the term *transformation* is restricted to designate the series of changes which every germ undergoes in reaching the embryonic condition; those which we observe in every creature still within the egg; and those which the species born in an imperfectly developed state present in the course of their external life; while metamorphosis, according to the same authorities, is defined as including the alterations which are undergone after exclusion from the egg, and which alter extensively the general form and mode of life of the individual.] (b) The change of one metal into another; transmutation of metals, according to the alchemists. (c) In *math.* the operation or process of changing in form or expression; as, (1) the change of a given geometrical figure into another of equal area, but of a different number of sides, or of a given solid into another of equal solidity, but having a different number of faces; (2) the change of the form of an equation without destroying the equality of its members; (3) the change of the form of a fraction without altering its value. There are three kinds of changes, designated by the terms *intussusception*, *apposition*, and *secretion*. (f) In *chem.* (1) change from solid to liquid or from liquid to gaseous state, or the converse; a change usually resulting merely from change of temperature, without any alteration in the atomic constitution of the bodies concerned, as the change of water into steam; (2) a change also resulting often from simple change of temperature, but which is accompanied by production of bodies differing profoundly in nature, chemical and physical, from the body started from, as the dissociation of steam into its component gases by the heat of incandescence.—*Transformation of forces*, the change of one form of force into another. See under FORCE.—*Transformation scene*, in *theatres*, a gorgeous scene at the conclusion of the burlesque of a pantomime, in which the principal characters are supposed to be transformed into the chief actors in the immediately following harlequinade.

This operation is of old date, but seems to have generally ended in failure until about 1824, the chief cause of failure probably being the want of due precautions to preclude the air during the process. In *astron.* (a) the passage of a heavenly body across the meridian of any place. The determination of the exact times of the transits of the heavenly bodies across the meridian of the place of observation enables the astronomer to ascertain the differences of right ascen-

slons, and the relative situations of the fixed stars, and the motions of the sun, planets, and comets, in respect of the celestial meridians. (b) The passage of one heavenly body over the disc of a larger one. But the term is chiefly restricted to the passage of the inferior planets, Mercury and Venus, over the sun's disc. The transits of Venus are of great importance in astronomy, as they afford the best means of determining the sun's parallax, and consequently the dimensions of the planetary system. These tran-

sits are of rare occurrence, four taking place in 243 years, at intervals reckoning from the transit of 1874, in the order of 8, 122, 8, and 105 years, which gives the transit years 1882 (Dec. 6), 2004, 2012, 2117. The transits of Mercury occur more frequently, but they are of far less astronomical interest, as they cannot be used for the same purpose, the planet being too distant from us. **Transit-instrument** (tran'sit-in-stru-ment), *n.* An important astronomical instrument, which consists essentially of a telescope fixed at right angles to a horizontal axis, having its ends directed to the east and west points of the horizon, so that the line of collimation of the telescope may move in the plane of the meridian. The instrument is susceptible of certain nice adjustments, so that the axis can be made perfectly horizontal, and at right angles to the plane of the meridian, in which plane the telescope must move. The principal use of the transit instrument is to determine the exact moment when a celestial body passes the meridian of the place of observation. See **TRANSIT**.

**Transition** (tran-si'zhon or tran-zí'shon), *n.* [L. *transitio*, from *transire*. See **TRANSIT**.] 1. Passage from one place or state to another; change; as, the transition of the weather from hot to cold.

So here the archangel paused Betwixt the world destroyed and world restored. . . . Then, with transition sweet, new speech resumes. *Milton.*

3. In *music*, a term used by some musicians corresponding in all respects to modulation, that is, any change in the course of a composition from one key to another; by others, to a rapid modulation or the passing through a key rapidly; and by others again (chiefly the tonic sol-faists) as distinguished from modulation, which is defined as a change of mode, that is, the passing from the major to the relative minor, and conversely, while transition is restricted to the passage from one major scale to another,

which may be more or less related.—This word is frequently used adjectively (chiefly in such a connection as shown in the quotation) as equivalent to passing from one place or condition to another; changing, transitional.

This will prove that we are once more in a transition state. *Gladstone.*

—**Transition rocks, transition series, or transition formations**, in *geol.* names formerly given to the older secondary rocks, or to the lowest uncrystalline stratified rocks, erroneously supposed to contain no organic remains, and so named because they were considered to have been formed when the world was passing from an uninhabitable to a habitable state. It corresponded to the graywacke formation of older geologists, now subdivided into the Cambrian and Silurian systems.

3. In *gram.* taking an object after it; denoting action passing to an object that is expressed; as, a transitive verb; a transitive usage. A transitive verb expresses an action which passes from the agent to an object, from the subject which does, to the object on which the act is done, as in the sentence, 'Cicero wrote letters to Atticus,' where wrote is a transitive verb. All verbs not passive may be arranged in two classes, transitive and intransitive.

Cod, whiting, and other white fish are taken by it in large numbers, and some kinds of flat fish, as soles, can scarcely be taken in any other way. Trawling can be practised only on a smooth bottom, as a rough bottom would destroy the net. The vessels employed in it on the east coast of England are from 35 to 60 tons, and the fishers often remain out for six weeks. The term is often incorrectly applied in Scotland to a mode of catching herrings by fishing with the seine.

See **TRADITION**.] A betraying, treachery, or breach of faith, especially by a subject against the sovereign, liege lord, or chief authority of the state. *Treason* against the sovereign has, in England, been always regarded as *high treason*, in contradistinction to certain offences against private superiors, which were formerly ranked as *petit* or *petty treason*. (See under **PETIT**.) There are a number of different species of treason, five of which were declared by an act passed in the time of Edward III.

(1) When a subject doth compass or imagine the death of the king, of his queen, or of their eldest son and heir. (2) If a man do violate the king's companion (that is, wife), or the king's eldest daughter unmarried, or the wife of the king's eldest son and heir. (3) If a man do levy war against the king within the realm. (4) Adhering to the king's enemies in his realm, or giving them aid or comfort. (5) Slaying the chancellor, treasurer, or king's justices. Several other kinds of treason were subsequently defined; thus in the time of Anne attempts to subvert the Act of Settlement were so characterized. So after the accession of Queen Victoria the marrying or promoting the marriage of any child of the present queen, being under eighteen years of age, should the crown

have descended to him or her, without the written consent of the regent and parliament was declared treason. Misprision or bare concealment of treason is no longer a capital offence. The counterfeiting of the king's privy or great seal and of the king's money was at one time also regarded as treason. The former punishment for treason was that the condemned should be drawn on a hurdle to the place of execution, and there to be hanged and disembowelled alive, and then beheaded and quartered; and a conviction was followed by forfeiture of land and goods, and attainder of blood; but this is now restricted to hanging, forfeiture and attainder being abolished by 33 and 34 Vict. xlii. In the United States treason is confined to the actual levying of war against the United States, or in adhering to their enemies, giving them aid and comfort.

such as those belonging to incorporated companies or private societies. — *Lord high treasurer*, formerly the third great officer of the crown, who had under his charge and government all the king's revenue, which is kept in the exchequer; but at present the duties of the lord high treasurer are discharged by commissioners entitled *lords of the treasury*. See **TREASURY**. — *Lord high treasurer of Scotland*, formerly an officer whose duty it was to examine and pass the accounts of the sheriffs and others concerned in levying the revenues of the kingdom, to receive resignations of lands and other subjects, and to revise, compound, and pass signatures, gifts of tutors, &c. In 1663 the lord high treasurer was declared president of the court of exchequer. — *Treasurer of the household*, an official in the lord-steward's department of the royal household of the United Kingdom, who bears a white staff, and ranks next to the lord-steward, for whom he is empowered to act in his absence. In this case the treasure belongs to the crown; but if the owner is known, or is ascertained after the treasure is found, the owner and not the crown is entitled to it. It is, however, the practice of the crown to pay the finder the full value of the property on its being delivered up. On the other hand, should the finder conceal or appropriate it he is guilty of an indictable offence punishable by fine and imprisonment.

**Treasureous** (trezh'ür-us), *a.* Worthy of being treasured or prized, or regarded as a treasure.

**Treasury** (trezh'ür-ri), *n.* 1. A place or building in which stores of wealth are deposited; particularly, a place where the public revenues are deposited and kept, and where money is disbursed to defray the expenses of government; also, a place where the funds of an incorporated company or private society are deposited and disbursed. — 2. A department of government which has control over the management, collection, and expenditure of the public revenue. The duties of this department in Britain are at present performed by a board of five lords-commissioners instead of a lord high treasurer, as in former times. The chief of these commissioners, or first lord of the treasury, is, by custom, the head of the administration or prime minister, and may be a member of either house of parliament. He has an extensive ecclesiastical, legal, and civil patronage, appoints all the chief officers of state, and regulates the various departments under the crown. As head of the executive his duties are so multifarious that he takes little practical control of the treasury unless he holds in addition the chancellorship of the exchequer, which he can only do, however, if he is a commoner. The virtual head of the treasury is the chancellor of the exchequer, who must be a member of the House of Commons, and who exercises the most responsible control over the expenditure of the different branches of the service. He prepares an annual estimate of the state expenses, and of the ways and means by which it is proposed to meet them, and lays this statement, called the budget, before the House of Commons. The duties of the three remaining members of the board, the junior lords, are merely formal, the heaviest portion of the executive functions devolving on the two joint secretaries of the department, who are also members of the lower

house, and on a permanent official secretary. One of the joint secretaries is usually the ministerial 'whip,' who has the non-official but important duty of looking after the interest of his party by securing the attendance of as many members as possible on his own side of the house at important divisions. The custody of the public revenue is vested in the exchequer, but the function of payment belongs to the treasury, consequently all sums withdrawn from the exchequer must be vouched for by a treasury warrant. The treasury has the appointment of all officers engaged in the collection of the public revenue; the army, navy, and civil service supplies are issued under its authority; and all exceptional cases and disputes relating to the public revenue are referred to its decision. Several important state departments, as the boards of customs and inland revenue, the post-office, the office of woods and forests, are under the general authority or regulation of the treasury. — *Treasury bench*, the front bench or row of seats on the right hand of the speaker in the House of Commons: so called because occupied by the first lord of the treasury (when a commoner), the chancellor of the exchequer, and other members of the ministry. — *Treasury board*, the five lords-commissioners of the treasury. — *Treasury warrant*, a warrant or voucher issued by the treasury for sums disbursed by the exchequer. — 3. The officers of the treasury department. See 2.—4. A repository, storehouse, or other place where valuable objects are collected; hence, fig. a collection of, or book containing, generally in small bulk, much valuable information or numerous striking thoughts on any subject; anything from which wisdom, wit, or knowledge may be abundantly derived; as, a *treasury* of botany; a *treasury* of wit. — 5. † A treasure. It is a rather repulsive looking animal, somewhat resembling the land slug in shape, but having rows of longish suckers on its body, and a radiated mouth. It varies in length from 6 to 24 inches. Much skill and care is required in the operation of curing, which is performed by gutting and boiling the slugs, and spreading them out on a perforated platform over a wood fire to dry. Sun-dried trepangs are in special request in China for making soups. The fishery is carried on in numerous localities in the Indian Ocean, the Eastern Archipelago, and on the shores of Australia. The centre-pin is fixed in the skull, and forms an axis round which the circular edge of the saw rotates, and as soon as the teeth of the saw have made a circular groove in which they can work steadily the centre-pin is removed. The saw is made to cut through the bone not by a series of complete rotations such as are made by the *trepan*, but by rapid half rotations alternately to the right and left, as in boring with an awl. The *trephine* is used especially in injuries of the head, and in cases resulting from injuries for which the removal of a portion of the brain is necessary. The use of the *trephine*, however, is now much more rarely required than in former times, owing to improved modes of treating cases to which it was formerly applied, and the invention of simpler and more effective instruments.

twelfth century. Triads are an arrangement of similar events, or things which might be associated in the mind, or be worthy of remembrance, &c., in a series of three.

Then there are the singular compositions called the *Triads*, which are enumerations of events or other particulars, bound together in knots of three, by means of some title or general observation—sometimes, it must be confessed, forced and far-fetched enough—under which it is conceived that they may all be included. Of the *Triads*, some are moral, and others historical. *Cruik.*

Civil actions in England are tried and heard in one of the following ways: (a) before a judge or judges; (b) before a judge sitting with assessors; (c) before a judge and jury; (d) before an official or special referee, with or without assessors. In England, as in the United States, civil trials, without a jury, are more common than formerly. — *New trials* in civil cases are granted where the court, of which the record is, sees reason to be dissatisfied with a verdict, on the ground of a misdirection by the judge to the jury, a verdict against evidence, excessive damages, improper evidence, fresh evidence discovered after the verdict was given, &c. — *Trial at bar*. The three angles of a plane triangle are equal to two right angles or 180°, and its area is equal to half that of a rectangle or parallelogram of the same base and altitude. The triangle is the most important figure in geometry, and may be considered the element of all other figures. If the three lines or sides of a triangle are all straight, it is a *plane* or *rectilinear triangle*, as figs. 1, 2, 3, 4. If all the three sides are equal, it is an *equilateral triangle*, fig. 2. The numbers taken on the horizontal lines are the coefficients of the different powers of a binomial. See **FIGURATE NUMBERS** under **FIGURATE**.—**Triangle of forces**, a name given to the proposition in statics which asserts that, if three forces meeting at a point in one plane be in equilibrium, and if on that plane any three mutually intersecting lines be drawn parallel to the directions of the three forces, a triangle will be formed the lengths of whose sides will be proportional to the magnitudes of the

forces.—**Supplemental triangle**. See under **SUPPLEMENTAL**.—2. A musical instrument of percussion, made of a rod of polished steel, bent into the form of a triangle, and open at one of its angles. **Trichina** (tri-kī'na), *n.* [Gr. *thrix*, *trichos*, a hair.] A minute nematoid worm, the larva of which was discovered in 1835 in the tissue of the voluntary muscles of man, giving rise to a disease since known as *trichiniasis*. The worm is common also to several other mammals, and especially to the pig, and it is generally from it that man receives the disease. When a portion of flesh, say of the pig, containing larvae is taken into the stomach the larvae in a few days become developed into procreative adults, having in the meantime passed into the intestines. The female begins to produce embryos in extraordinary numbers, which gain entrance into the muscles by penetrating the mucous coat of the intestine and entering the capillaries, whence they are carried to their habitat by the circulation. There they disorganize the surrounding tissue, setting up at the same time morbid action in the system. The connection between the muscle-inhabiting larva and the adult intestinal parasite was not established till 1860. The larva is generally encased in a cyst covered with calcareous matter, and from the form it assumes in this case it is called at this stage *Trichina spiralis*.

The species are strong-scented herbs with trifoliate leaves, and small blue, yellow, or white flowers, growing singly or in heads or racemes in the axils of the leaves. They are natives chiefly of Europe, Asia, and North Africa. *T. fœnum græcum* (the common fenugreek) is a native of the South of Europe. Its seeds were in high repute among the ancient Egyptians, Greeks, and Romans for medicinal as well as culinary purposes, and are still used by grocers and farmers as a medicine for horses. In some parts of the south of Germany this plant is cultivated as fodder for horses and sheep.

**Trigonia** (tri-gō-ni-a), *n.* [See *TRIGON*.] 1. A genus of lamellibranchiate molluscs, belonging to the section Asiphonida and family Trigoniidae. The Trigonia is a triangular or suborbicular, equivalve, transverse bivalve. The species are found both recent and fossil. The former have been discovered near Australia only, in sandy mud. They have been termed *Trigonia margaritacea*, or pearly trigon, from their pearly lustre. The fossil species are very abundant in the strata between the lias and the chalk. None are tertiary. — 2. A genus of plants constituting the nat. order Trigoniaceae.

**Trigonaceae** (tri-gō-ni-ā-sē-ē), *n. pl.* A nat. order of polypetalous dicotyledonous trees, consisting of a single genus, Trigonia. **Trigonometrical** (tri-gō-nō-met'rik-al), *a.* Pertaining to trigonometry; performed by or according to the rules of trigonometry. — *Trigonometrical canon*, a table which, beginning from one second or one minute, expresses in order the lengths which every sine, tangent, and secant have in respect of the radius, which is supposed unity. — *Trigonometrical curves*, a name given to certain curves which have such equations as  $y = \sin x$ ,  $y = \cos x$ ,  $y = a \cos x + b \cos 2x$ , &c. These curves may be constructed from the fundamental properties of the sine, cosine, &c. — *Trigonometrical lines*, lines which are employed in solving the different cases of plane and spherical trigonometry, as radius, sines, tangents, secants, cosines, cotangents, cosecants, &c. These lines, or the lengths of them, are called the *trigonometrical functions* of the arcs to which they belong. When an arc increases through all its values from 0° to 360°, the sines and cosines are positive in the first and second quadrants, and negative in the third and fourth; the tangents and cotangents are positive in the first and third, and negative in the second and fourth; the cosines and secants are positive in the first and fourth, and negative in the second and third; and the versed sines are positive in all the four quadrants. — *Trigonometrical series*, infinite series which are of the form  $a \sin x + b \sin 2x + c \sin 3x$ , &c., and  $a \cos x + b \cos 2x + c \cos 3x$ , &c. — *Trigonometrical survey*, a term which may be applied to any survey of a country which is carried on from a single base, by the computation of observed angular distances; but the term is usually confined to measurements on a large scale, embracing a considerable extent of country, and requiring a combination of astronomical and geodetical operations. A trigonometrical survey may be undertaken either to ascertain the exact situation of the different points of a country relatively to each other, and to the equator and meridians of the terrestrial globe, for the purpose of constructing an accurate map, or to determine the dimensions and form of the earth, by ascertaining the curvature of a given portion of its surface, or by measuring an arc of the meridian. The most minute accuracy and the most perfect instruments are required in all the practical parts of such operations; and it becomes necessary to have regard to the curvature of the earth's surface, the effects of temperature, refraction, altitude above the level of the sea, and a multitude of circumstances which are not taken into account in ordinary surveying. In conducting a trigonometrical survey of a country (as the ordnance survey of Britain), signals, such as spires, towers, poles erected on elevated situations, or other objects, are assumed at as great a distance as will admit of distinct and accurate observations, with telescopes of considerable power attached to the instruments used in measuring the angles. In this way, starting from a measured base-line, the country will be divided into a series of connected triangles called *primary triangles*; and any side of any one of these being known, the remaining sides of all of them may be computed by trigonometry. By means exactly similar, each of these triangles is resolved into a number of others called *secondary triangles*; and thus the positions of towns, villages, and other objects are determined. The length of the base or line measured, which is an arc of a great circle, must be determined with extreme accuracy, as an error in measuring it would affect the entire survey. For checking the measurements and the computations it is proper to measure some other line at a considerable distance from the first, as the comparison of its measured and computed lengths will be a test of the accuracy of the intermediate operations. Such a line is called a base of verification. The measurement of a base is one of the principal difficulties in the survey, chiefly on account of the inequalities of the earth's surface, and the variations in the length of the measuring instrument, arising from the change of temperature.

The base is assumed on as flat a portion of country as can be obtained, and the chain or other measuring instrument is constructed with extreme care.

**Trigonometrically** (tri-gō-nō-met'rik-al-ly), *adv.* In a trigonometrical manner; according to the rules or principles of trigonometry.

**Trigonometry** (tri-gō-nō-met'ri), *n.* [From Gr. *trigōnōn*, a triangle, and *metron*, a measure.] According to the primitive meaning of the term, the measuring of triangles, or the science of determining the sides and angles of triangles, by means of certain parts which are given; but in its modern acceptation it includes all theorems and formulæ relative to angles and circular arcs, and the lines connected with them, these lines being expressed by numbers or ratios. In fact, the principles of trigonometry are of very general application, furnishing means of investigation in almost every branch of mathematics. Trigonometry, in relation to its practical utility, may be regarded as the most important of all the applications of mathematics, especially in relation to astronomy, navigation, and surveying. Trigonometry is of two kinds, *plane* and *spherical*, the former treating of triangles described on a plane, and the latter of those described on the surface of a sphere. In every triangle there are six things which may be considered, viz. the three sides and the three angles, and the main object of the theoretical part of trigonometry is to deduce rules by which, when some of these are given, the others may be found by computation, such computations being facilitated by tables of sines, tangents, &c. In plane trigonometry any three of the six parts of a triangle being given (except the three angles), the other parts may be determined; but in spherical trigonometry this exception

has no place, for any three of the six parts being given, the rest may thence be determined, the sides being measured or estimated by degrees, minutes, &c., as well as the angles.

The mode in which trigonometrical definitions are given is as follows:—Let ABC be a right-angled triangle, then

$\frac{BC}{AC} = \text{sine of } A$ ;  $\frac{AB}{AC} = \text{cosine of } A$ ;  $\frac{BC}{AB} = \text{tangent of } A$ ;  $\frac{AB}{BC} = \text{cotangent of } A$ ;  $\frac{AC}{BC} = \text{secant of } A$ ;  $\frac{AC}{AB} = \text{cosecant of } A$ ;  $1 - \text{cosine of } A = \text{versed sine of } A$ ;  $1 - \text{sine of } A = \text{co-versed sine of } A$ . Both plane and spherical trigonometry is divided into right-angled and oblique-angled.

Trilobites are especially characteristic of the Silurian strata; about a dozen genera appear in the Devonian, three or four in the carboniferous, and none higher. They comprehend those species in which the body is divided into three lobes, which run parallel to its axis. Trilobites are supposed by Burmeister to have moved by swimming in an inverted position, belly up, immediately beneath the surface of the water. When attacked they could roll themselves into a ball. They fed on small water animals, and inhabited gregariously and in vast numbers the shallow water near coasts. No antennae or limbs have yet been detected; 'still,' says Owen, 'there can be no doubt they enjoyed such locomotive powers as even the limpet and chiton exhibit.' The lenses of the eye are frequently beautifully preserved so as to be perceptible by the naked eye. In *Asaphus caudatus* each eye has 400 facets, and in *A. tyrannus* 6000. The term belongs more particularly to the Greek drama. On the Athenian stage it became customary to exhibit on the same occasion three serious dramas or a *trilogy*, at first connected together by a sequence of subject, but afterwards unconnected and on distinct subjects, a fourth or satyric drama being also added, the characters of which were satyrs. It was apparently from a tripod of this nature, with a flat round top added to be used as a seat, that the Pythian priestesses at Delphi gave their oracular responses. The celebrity of this tripod led to innumerable imitations of it, which were made to be used in sacrifice; and beautifully ornamented tripods of similar form, made of the precious metals, were given as prizes at the Pythian games and elsewhere, and were frequently placed as votive gifts in the temples, especially in that of Apollo.—2. It was granted by the senate only to one who had held the office of dictator, of consul, or of pretor, and after a decisive victory or the complete subjugation of a province. In a Roman triumph the general to whom this honour was awarded entered the city of Rome in a chariot drawn by four horses, crowned with laurel, and having a sceptre in one hand and a branch of laurel in the other. He was preceded by the senate and magistrates, musicians, the spoils, the captives in fetters, &c., and followed by his army on foot, in marching order. The procession advanced in this order along the *via sacra* to the Capitol, where a bull was sacrificed to Jupiter, and the laurel wreath deposited in the lap of the god. Banquets and other entertainments concluded the solemnity, which was generally brought to a close in one day, though in later times it sometimes lasted for three days. Tropes are chiefly of four kinds: metaphor, metonymy, synecdoche, and irony; but to these may be added allegory, prosopopœia, antonomasia, and perhaps some others. Some authors make figures the genus, of which trope is a species; others make them different things, defining trope to be a change of sense, and figure to be any ornament except what becomes so by such change.

In *antiq.* a monument or memorial in commemoration of some victory. It consisted of some of the arms and other spoils of the vanquished enemy, hung upon the trunk of a tree or a stone pillar by the victorious army, either on the field of battle or in the capital of the conquered nation. If a naval victory, it was erected on the nearest land. The custom of erecting trophies was most general among the Greeks, but it passed at length to the Romans. It was the practice also to have representations of trophies carved in stone, in bronze, and other solid substances. In modern times trophies have been erected in churches and other public buildings to commemorate victories. — 2. Anything taken and preserved as

The sun's annual path in the heavens is bounded by these two circles, and they are called *tropics*, because when the sun, in his journey northward or southward, reaches either of them, he, as it were, *turns back*, and travels in an opposite direction in regard to north and south. — 2. Fundamental truths, like the lights of heaven, are not only beautiful in themselves, but give light to other things, that, without them, could not be seen.

According to Dr. Reid, the truths that fall within the compass of human knowledge, whether they be self-evident or deduced from those that are self-evident, may be reduced to two classes, namely, necessary, immutable, or first truths, and contingent and mutable truths. A necessary truth is one that depends not upon the will and power of any being; it is immutably true, and its contrary impossible. A contingent truth is one which depends upon some effect of will and power, which had a beginning and may have an end. Of the first class are the relations of numbers (as that two and two make four), axioms in mathematics, and all the conclusions drawn from them; that is, the whole body of the science of mathematics. To the second class of truths, viz., those that are contingent, belong all those truths that express matters of fact or real existences (as that grass is green), depending upon the will and power of the Supreme Being.—In truth, in reality; in fact; in sincerity.

growth, and not a mere enlargement of a natural part, which is called hypertrophy. Tumours may be divided into three well-defined classes: (a) *simple, solid, benign, or innocent tumours*, the substance of which has anatomical resemblance to some tissues of the body; they gradually increase in size, and generally only produce inconvenience from the great bulk they sometimes attain; a complete cure may be effected by simple excision. (c) *Semi-malignant tumours*, which closely resemble in structure the part in which they are seated; they may recur after excision, or may gradually spread to all the neighbouring tissues, and ultimately cause death by ulceration; but they do not affect the lymphatic system nor reappear in remote parts of the body after excision. Innocent tumours are often named from the tissues in which they occur, as *adipose or fatty tumours*, *fibrous tumours*, *cartilaginous tumours*, *bony tumours*, and the like. **Tunker** (tung'kēr), *n.* [G. *tunken*, to dip.] One of a religious sect in America which was founded by Conrad Peysel, a German, in 1724, and which takes its name from the mode of baptizing converts by plunging them three times into the water. They reject infant baptism; use great plainness of dress and language; refuse to take oaths or to fight; and anoint the sick with oil in order to their recovery, depending upon this unction and prayer, and rejecting the use of medicine. Every brother is allowed to speak in the congregation, and their best speaker is usually ordained to be their preacher. Also called *Dipper*, *Dunker*, and *Tumbler*.

3. In *engin.* a subterranean passage cut through a hill, a rock, or any eminence, or under a river, a town, &c., to carry a canal, a road, or a railway in an advantageous course. In the construction of canals and railways tunnels are frequently had recourse to in order to preserve the desired level, and for various other local causes. Tunnels when not pierced through solid rock have usually an arched roof and are lined with brickwork or masonry. The sectional form of the passage is various. The cuts show two sections of the St. Gothard tunnel, which connects the railway systems of Switzerland and Germany with that of Italy, and has the great length of fully  $9\frac{1}{4}$  miles. The one section

shows how in some parts the tunnel requires to be strengthened with an arching of masonry all round to resist pressure upwards as well as downwards; the other shows the internal masonry in its more common form.—4. In *mining*, a level passage

driven across the measures, or at right angles to the veins which its object is to reach; and thus distinguished from the *drift* or *gangway* which is led along the vein when reached by the tunnel. *Goodrich*.—5. A tunnel-net (which see).

The English form may be directly from the Italian, modified to give it an English look.] A fish of the genus *Thynnus* and family Scomberidae, the *T. vulgaris*, closely allied to the mackerel.

These fish live in shoals in almost all the seas of the warmer and temperate parts of the earth. They are taken in immense quantities on the Mediterranean coasts, where the fishing is chiefly carried on. The flesh, which somewhat resembles veal, is delicate, and has been in request from time immemorial. by the escape of water through orifices, under the influence of pressure derived from a fall. Turbines are now made after a vast variety of patterns. The oldest and simplest is the Scotch turbine, or Barker's mill (which see). In another common form the water passes vertically down through the wheel between fixed screw blades, which give it a spiral motion, and then strikes similar blades attached to a movable spindle, but placed in the opposite direction, so that the impact of the water communicates a rotatory motion to the blades and spindles. Or the

water may be passed from the centre horizontally outwards through fixed curved blades, so as to give it a tangential motion, and thereby cause it to act on the blades of the wheel which revolves outside. In the example represented in the annexed cut, the water is introduced into a close cast-iron vessel *a*, by the pipe *b*, connecting it with the reservoir. Here, by virtue of its pressure, it tends to escape by any aperture which may be presented; but the only apertures consist of a series of curved float-boards *ff*, fixed to a horizontal plate *g*, mounted upon a central axis *h*, which passes upwards through a tube connecting the upper and lower covers, *c* and *d*, of the vessel *a*. Another series of curved plates *ee*, is fixed to the upper surface of the disc *d*, to give a determinate direction to the water before flowing out at the float-boards, and the curves of these various parts are so adjusted as to render the reactive force of the water available to the utmost extent in producing a circular motion, and thus carrying round the disc and the axis *h* with which the machinery to be impelled is connected.

Dies and Brachet, however, would derive Fr. *turbot* from L. *turbo*, a whipping top, comparing Gr. *rhombos*, which means both top and turbot, there being a supposed similarity in shape. The latter part of the word might also be explained as meaning flat-fish by itself=*but* in *halibut*, D. *bot*, a plaice, G. *butte*, a flat-fish; comp. also G. *butt*, Dan. *but*, short and thick.] A well-known and highly esteemed fish of the genus *Rhombus* or *Pleuronectes* (*R.* or *P. maximus*), family *Pleuronectidæ* or flat-fishes. 3. The art or operation of giving circular and

other forms to bodies, as wood, metal, bone, ivory, &c., by making them revolve in various manners in a machine called a *lathe*, and applying cutting instruments so as to produce the form required, or by making the cutting instrument revolve when the substance to be operated upon is fixed. In ordinary turning the body operated upon is made to revolve on a stationary axis, and a cutting tool applied to its surface in such a way as, in the circumvolutions of the object, to cut off those parts which lie farthest from the axis, and make the outside of the substance concentric with the axis. In this case any section of the work made at right angles to its axis will be of a circular figure; but there are methods of turning several other curves in a variety of ways. **Turnip** (tér'nip), *n.* [Formerly also *turnep*. The latter part of the word is a Sax. *nap*, Icel. *neypa*, Sc. *neip*, a turnip, borrowed from L. *napius*, a turnip or plant allied to the turnip. It is difficult to account for the first syllable. It may perhaps be W. *tor*, something bulging, a belly, the epithet being applied to distinguish the turnip from the rape or cabbage that do not have a swelling root; but this explanation is not quite satisfactory.] The common name of the *Brassica Rapa*, a cruciferous, biennial plant, much cultivated both in the field and in the garden on account of its esculent root. The radical leaves are oblong and lyrate, the upper ones entire; the flowers usually yellow. The upper part of the root, which in the wild state is a comparatively hard woody substance, has been transformed by cultivation into a large fleshy bulb. The turnip, as a culinary vegetable and as a cattle food, was well known to the Greeks and Romans, the latter of whom may have introduced it into gardens in Britain. The root is generally used as a culinary vegetable in all temperate climates; the leaves and flower-shoots are used as greens, and the seed-leaves as a salad. The field culture of the larger-rooted varieties has proved of great advantage to the British farmer, supplying a very valuable rotation crop, and providing a winter food for cattle and sheep. The most advantageous mode of field culture is by drills, which will produce crops of treble the weight of those grown in the broadcast manner. The roots of the turnip have often a tendency to divide and become hard and worthless—a condition known as *finger-and-toe*, or *dactylorhiza*. This disease seems to be a tendency of the plant to return to the wild state, and is best met by the farmer using new and selected seed. The plant thrives best on a rich and free soil and in moist cloudy weather. The Swedish turnip is probably a hybrid between *B. campestris* and *B. Rapa* or *Napus*. *B. Napus* yields rape, cole, or colza seeds, from which a well-known fixed oil is expressed.

**Turn-table** (tér'n'tâ-bl), *n.* In *rail*, a circular platform of iron and wood, supported on rollers, and turning upon a centre without much friction, even when loaded with a considerable weight. In fig. 1, *aa* are solid rails of wrought iron, corresponding with the gauge of the lines *AB*; *k* is a rim of iron within which the plate turns, but the space within the rails *bb* is in general covered with wood; *lll* are latches fixed on the outer rim, and dropping into notches as at *m*. When a carriage is to be transferred from the track *AA* to *BB*, it is pushed on to the turning-plate *T*, and the latches which hold the plate being raised, the table with the carriage upon it is turned a quarter round into the position shown by the dotted line *K*. The carriage is then rolled upon the turning-plate *U* (at *B*), which

being in like manner turned a quarter round, the carriage is in a proper position for being moved on to the track *BB*. By this arrange-

Oil or spirits of turpentine is used in medicine externally as an excellent rubefacient and counter-irritant, and internally as a vermifuge, stimulant, and diuretic. parts of the atmosphere which are still illuminated after the sun has become invisible from ordinary heights. The morning twilight is said to begin, and the evening twilight to end, in our latitudes when the sun is 18° below the horizon, but much depends on the state of the atmosphere as to clouds, &c. Twilight is of longer duration in high latitudes than at or near the equator on account of the obliquity of his course. When he sinks perpendicularly below the horizon naturally there is little twilight—2. A faint light in general. 'Mid the dim twilight of the laurel grove.' *Milman*. Hence—3. **Type-writer** (tip'rit-er), *n.* A machine intended to be used as a substitute for the pen, and by which the letters are produced by the impression of inked types. The essential elements in such machines (of which there are several varieties) is a movement to bring the type into position, an inking device, an impression movement, and means for letter and line spacing. A successful form of the machine has a series of letter keys arranged in four rows, to be worked by the fingers of both hands, a letter being imprinted on the paper (which moves automatically) each time a key is struck.

The typical genus is *Typhlops*, and there are several others.

**Typhoid** (ti'foid), *a.* Of, pertaining to, or resembling typhus; as, a *typhoid fever*; *typhoid symptoms*.—*Typhoid fever*, a species of continued fever, characterized by abdominal pains and diarrhoea due to ulceration of the intestines, frequently by derangement in the functions of the lungs and brain, by spots on the skin, and analogous in many respects to eruptive fevers. Unlike the spots of typhus those of typhoid fever disappear on pressure. By some authorities typhoid and typhus fevers have been regarded as the less and greater degree of one common disease, but the majority of physicians now consider them to be distinct diseases with certain resemblances. Typhus has generally prevailed as an epidemic where insanitary conditions, overcrowding, and famine have prevailed; the rebreathing of air loaded with emanations from crowded living beings being its chief cause. Typhoid, on the other hand, is now far more common, occurring among all classes of society, in isolated and healthy villages, as well as in the larger cities. It may be induced by purely external causes, as by bad ventilation, sewer-gas, exhalations of decomposing matter in cellars or near houses, privies, and especially the contamination of drinking water. It is also of longer duration than typhus, there being at least three full weeks of the active fever, followed by several weeks' gradual convalescence, while in the average from typhus speedy recovery ensues at the end of the second week. Known also as *Enteric* and *Gastric Fever*.

**Typhus** (ti'fōs), *n.* [Gr. *typhos*, stupor or coma.] A species of continued fever attended by great debility. It is contagious or infectious, and often epidemic, but is most prone

to attack debilitated persons, and is aided in its progress by want of cleanliness, good food, and fresh air. With the sanitary reform of overcrowded localities, barracks, jails, ships, &c., the prevalence of this plague has now been considerably diminished. Its attack is generally characterized by inordinate muscular and nervous debility, great depression of spirits, weariness, flying pains, sighing, and a frequent, small, and sometimes fluttering pulse. The tongue is foul and brown, and the taste impaired, and not unfrequently nausea and bilious vomiting prevail. About the fourth or fifth day an eruption of a deep livid colour appears on the abdomen, the spots of which do not disappear on pressure, as those of typhoid do. As the disease advances the debility increases; the speech becomes inarticulate, muttering, and delirious, and there is a tendency to bleeding from the nose, mouth, and bowels. Typhus is frequently fatal, death in the majority of cases supervening before the fifteenth day after attack. This disease is also known as hospital fever, ship-fever, jail-fever, camp-fever, brain-fever, and spotted fever, and has sometimes been considered as an acute form of fever of which typhoid is a less virulent example. See *TYPHOID*.

## U.

**U.** The twenty-first letter and the fifth vowel in the English alphabet. Its true primary sound was that which it still retains in most of the languages of Europe, that of *oo* in *cool*, *tool*, *good*, *wood*, &c., answering to the French *ou* in *tour*, the sound being sometimes short, sometimes long. This sound is one of the original Indo-European vowel-sounds. (See *A*.) In Anglo-Saxon the long sound was often marked with an accent to distinguish it from the short. The former has in modern English commonly become the diphthong *ou* or *oo*, as *A. Sax. thū = thou*, *nū = now*, *mūth = mouth*, &c. After *r*, however, and also after the sounds *sh* and *zh*, *u* has generally the old long sound, as in *rule*, *truth*, *sure*, &c., and the same sound differently represented is still heard in *room* = *A. Sax. rām*, *brook* (verb) = *A. Sax. brācan*. The old short sound of *u* is still retained in some words, as in *bull*, *full*, *put*, &c., but in general this sound became changed (apparently about the middle of the seventeenth century) to the sound heard in *cut*, *tun*, &c., which was a new sound in English. In *us*, *but*, the *u* was originally long. This sound, which is very similar to that of the unaccented French *e*, is characteristic of English, and is often given to the other vowels, *a*, *e*, *o*, when unaccented, as in the words *cavalry*, *sister*, where the italicized vowels have almost, if not altogether, this indistinct, stifled *u*-sound. In the case of *o* this pronunciation is not confined to unaccented vowels, as in numerous instances the accented *o* is exactly equivalent to this sound of *u*; for example, *come*, *money*, *among*, &c. The long sound that this letter commonly represents at the present day, as in *mute*,

*pure*, *duke*, *diffuse*, &c., is not a simple vowel, the *u*-sound having really an *i*-sound before it. This latter sound seems to have established itself about the beginning of the seventeenth century. Some speakers give *u* this sound even after *r*, but the letter is not commonly so pronounced. Vulgar speakers, again, pronounce such words as *duke*, &c., as if they were written *dook*, &c. The words *bury* and *busy* (with their derivatives) exhibit solitary peculiarities in the pronunciation of this character. The sound of *u* in *mute* is also represented by other combinations, as by *ue* in *due*, *ew* in *deu*, and *ui* in *suit*. With regard to *ue* the remark has been made 'that it is used in later spelling as a final *u* owing to a rule made by no one knows whom, no one knows why, and no one knows when, that no English word can end in *u*.' (*A. J. Ellis*) In *plague*, *rogue*, &c., *ue* indicates that the preceding vowel is to be pronounced long and the *g* with its hard sound; in *language* it is a useless excrescence. Besides the sound in *suit*, *ui* has several other sounds, as in *build*, *guide*, *fruit*, *anguish*, *mosquito*, &c. In *buoy* the *u* is no longer heard, and probably it never was heard in *buy*. In the best period of Roman literature the *u*-sound was expressed by the character *V*. The Anglo-Saxon alphabet did not have the character *V* at all, the sound, when it occurred (as between two vowels) being represented by *f*, or occasionally by *u*. In later times *u* and *v* stood indifferently for either sound, the capital being generally written *V*. In the seventeenth century its special function was assigned to each, yet almost every dictionary continued to combine the *u* and *v*, and this was not

quite given up till far on in the present century.—*U*, in *chem.* is the symbol of uranium. *U.C.*, in dates belonging to Roman history, is a contraction for *ab urbe condita*, from the time the city was built; as, *U.C. 400*, the year of Rome 400. *U.K.*, the United Kingdom. *U.P.*, in Scotland, United Presbyterian. *U.S.*, United States. *U.S.A.*, United States of America.

The seed is pendulous, and contains a large quantity of albumen in proportion to the size of the embryo. There are about 152 genera and 1300 species. Some are very poisonous, as hemlock, fool's parsley, and others; others are esculents, as celery, carrots, and parsnips; many yield aromatics, as caraway, coriander, dill, anise; a few secrete a foetid gum-resin, much used in medicine, as asafetida, galbanum, opopanax, and sagapenum.

**Umlaut** (ôm'lout), *n.* [G., from prefix *um*, indicating alteration, and *laut*, sound=change of sound.] In *philol.* the change of a vowel in one syllable through the influence of one of the vowels *a*, *i*, *u* in the syllable immediately following—a common feature in several of the Teutonic tongues. In German umlaut is seen in the frequent change of the vowels *a*, *o*, *u* to *ä*, *ö*, *ü*. In Anglo-Saxon it was very common, and it still appears in the plurals *feet* and *geese*, from *foot* and *goose*, the vowels being changed by an *i* that originally followed. Umlaut is therefore a kind of assimilation of sounds. The change caused by *a* is called *a-umlaut*, and so of the others.

The conception of a sound tends to put the vocal organs in a position to utter it. We conceive the later sounds in a word while yet speaking the former; hence the tendency to utter a sound between the two. No umlaut shows in Gothic. Old H. German has most *a-umlaut*; Norse, *u-umlaut*. *Prof. March*.

The loss of initial *n* (see *APRON*) would be assisted by the collateral form *impier*, from Fr. *impar*, *L. impar*, uneven, odd. Lit. an odd person, in addition to a pair.] 1. A person to whose sole decision a controversy or question between parties is referred; one agreed upon as a judge, arbiter, or referee, in case of conflict of opinions. E. words with this prefix were not uncommon.] Boundary line; extreme edge. 'Such towns as stand . . . on the very umstroke, or on any part of the utmost line of a map.' *Fuller*.

**Un-** A prefix derived from two sources with two uses, viz. those of negation and those of reversal or undoing, and hence privation. 1. [A. Sax. *un-*, O. Sax. and Goth. *un-*, G. *un-*, D. *on-*, Icel. *ú-*, *ó-*; cog. with *L. in-*, Gr. *an-*, *a-*, Skr. *an-*, *a-*, all signifying not.] Expressive of simple negation. In this sense it is used chiefly before adjectives, past participles passive, and present participles used adjectively, and when so used it signifies simply not; as, *unable*, *unfair*, *untrue*, *untruthful*, *unwise*, *uninvited*, *unwedded*, *unseen*, *unaccommodating*, *unchanging*, *undoubting*, *unthinking*, &c. From such words again adverbs in *-ly* and nouns in *-ness* are formed; hence, *unfairly*, *unfairness*, *untruthfulness*, *unchangingly*, &c. It is also directly prefixed to some nouns to express the absence or contrary of what the noun expresses, as in *untruth*, *undress*, *unrest*, *unwisdom*, &c. Before many words of Latin origin, *un-* in the sense of mere negation, is naturally represented by *in* or *by non*, and sometimes by *dis*; thus, for *uncomplete* we have *incomplete*; for *unability*, *inability*; for *unelastic*, *inelastic* and *non-elastic*; for *unemphatic*, *non-emphatic*; for *unreputable*, *disreputable*, &c.—2. [A. Sax. *on-*, *ond-*, and, as in *on-léan*, to unlock, *on-léan*, to unloose,

and *un-earian*, to answer, &c.; Icel. O. Sax. and Goth. *and-*, G. *ant-*, as in *ant-worten*, to answer; cog. *L. ante*, before; Gr. *anti*, against, opposite; Skr. *anti*, over against.] Prefixed to verbs (generally active transitive) it signifies properly the reversing or annulling of the action expressed by the verb; as, *undo*, *unlearn*, *unlock*, *unmake*, &c. When prefixed to nouns it changes them into verbs implying privation of the object named by the noun or of the qualities connoted by it. Thus *unfrock*, *uncowl*, *uncoat*, *unhelm*, &c., signify to deprive or divest of a frock, cowl, &c., while *unman*, *unsex*, *unshape*, signify to deprive of the qualities of a man, sex, &c. This is sometimes called *un-privative*. Another peculiar use of this *un* is found in a few verbs, chiefly obsolete, where it is used in the sense of retract or revoke, as *unpredict*, *unsay*, *unspeak*, *unswear*, to retract a prediction, a saying, &c. As further illustrating the force of *un* in both its senses we may remark that under the form *unlearned* we have really three words—one an adjective signifying illiterate; as, an *unlearned* man (*un-*, not, and adj. *learned*); one a true past participle of the active verb to *unlearn* (*un-* in sense 2 and *learn*); as, all you have learned must be *unlearned*; and, finally, one formed by prefixing *un* negative to the past participle of the active verb to *learn*; as, his *task* is still *unlearned*. Some words with *un-* prefixed are hardly used unless qualified by *not*; thus we speak of a *striking* prospect, but we should not be likely to say an *unstriking* prospect, though we should readily say the prospect is *not unstriking*.—[Note. Adjectives and participles with the prefix *un-*, in the sense of not, being almost unlimited in number, and their meaning generally so obvious, many of them are omitted from this work, as well as their derivative adverbs in *-ly* and nouns in *-ness*. When such words, however have a special signification or usage of their own, and are not simply to be explained as equivalent to 'not' and their latter element, they are admitted into the vocabulary. As words of this kind may be instanced *unruly*, *unconscionable*, *unpretending*, *unparalleled*, *unsafe*, and the like. Verbs and nouns with *un* as a prefix (such as *unlock*, *untruth*) are also carefully defined, as they belong to a limited class, and are not coined at will by writers or speakers. It may also be added that a number of the words below have only been inserted because used by writers of more or less eminence.]

When these undulations reach and act on the nerves of our retina, they produce in us the sensation of light. The only other theory of light which can be opposed to this, and which is variously called the *corpuscular emission*, or *material theory*, supposes light to consist of material particles, emitted from the source, and projected in straight lines in all directions with a velocity which continues uniform at all distances, and is the same for all intensities. It would seem that every phenomenon which can be brought under the corpuscular theory can with equal facility be explained by the undulatory theory; while there are some known effects, as the phenomena of reflection and refraction, in strict accordance with the principles of the latter, which cannot, without great difficulty and the introduction of gratuitous suppositions, be accounted for by the corpuscular theory. The undulatory theory is therefore now generally adopted by physicists.

A kind of device for a flag either used by itself or forming the upper inner corner of an ensign; a flag marked with this device. cross of St. George (red on a white ground), the diagonal cross or saltire of St. Andrew (white on a blue ground), and the diagonal cross or saltire of St. Patrick (red on a white ground). The national flag of England was the banner of St. George (heraldically described as argent, a cross gules), and soon after the union of the crowns this was united with the Scottish national flag or banner of St. Andrew (in the language of heraldry azure, a saltire argent), thus forming the first union flag. On the legislative union with Scotland in 1707 a new design for the national or union flag was adopted, described in heraldic terms as azure, a saltire argent surmounted by a cross gules fimbriated or edged of the second. On the union with Ireland the red cross or saltire of St. Patrick was introduced, and as thus modified the flag now exists. The union flag, when used by itself or as an independent flag, is the national banner always used on shore. When it occupies the upper corner or canton next the staff of a red, white, or blue field, the flag so formed is called the red, white, or blue ensign, and in this form it is only used on board ship. (See JACK.) The union of the United States is a blue field with white stars, the stars denoting the union of the States and properly being equal in number to the states. The name seems also to be given to a corresponding portion of any flag.—6. A single thing or person regarded as having oneness for its main attribute; a single one of a number, forming the basis of count or consideration; as, each of us is but a *unit*.—2. In *arith.* the least whole number, or one, represented by the figure 1. Every other number is an assemblage of units. This definition is applicable to fractions as well as to whole numbers. Thus, the fraction  $\frac{7}{5}$  is an assemblage of seven units, each of which is one-tenth of the integer.—3. In *math.* and *physics*, any known determinate quantity by the constant repetition of which any other quantity of the same kind is measured; that magnitude which is to be considered or reckoned as one when other magnitudes of the same kind are to be measured. It is not itself one, but is the magnitude which one or 1 shall stand for in calculation. It is a length, or a surface, or a solid, or a weight, or a time, as the case may be, while 1 is only a numerical symbol.—*Abstract unit*, the unit of numeration; the number represented by 1.—*Concrete or denominate unit*, a unit which expresses also character, as one foot, one pound, one yard.—*Decimal and duodecimal units*, those in scales of numbers increasing or decreasing by ten or twelve.—*Unit of measure*, a certain conventional dimension or magnitude assumed as a standard by which other dimensions or magnitudes of the same kind are to be measured, as a foot, a gallon, an ounce, a pound, an hour, and the like. The system of units recommended by a committee of the British Association for scientific calculations, and known as the *C.G.S. system*, adopts the *centimetre* as the unit of length, the *gramme* as the unit of mass, and the *second* as the unit of time, these words being represented respectively by the above letters. In this system the *unit of area* is the square centimetre, the *unit of volume* is the cubic centimetre, and the *unit of velocity* is a velocity of a centimetre per second. The *unit of momentum* is the momentum of a *gramme* moving with a velocity of a centimetre per second. The *unit-force* is that force which acting on a *gramme* for one second generates a velocity of a centimetre per second. This force is called a *dyne* (which see). The *unit of work* is the work done by the force of a *dyne* working through a distance of a centimetre. This is called an *erg* (which see).—*The unit of heat, or thermal unit*, in Britain, the quantity of heat which corresponds to 1° Fahr. in the temperature of 1 lb. of pure water at about 39° Fahr.; in France, the heat required to raise a *gramme* of pure water at about 39° C., 1° C.—In *elect.*: *unit of resistance*, see under RESISTANCE; *unit of tension*, a volt, which is to the tension of a Daniell's cell as 9268 is to 1 079; *unit of quantity*, that

One who ascribes divinity to God the Father only; specifically, one of a religious sect or congregations, distinguished by the denial of the received doctrine of the Trinity. The Unitarians may be divided into two classes: (1) The conservative or orthodox Unitarians, who accept the general articles of the Christian creed (with the exception of the Trinity, such as miracles, the resurrection of Christ, and the plenary inspiration of Scripture). (2) The liberal or progressive Unitarians, whose creed is purely rationalistic. They consider Christ as a mere man, inspired as other great men are, though in a greater degree; they reject the doctrines of original sin, eternal punishments, the belief in miracles, and generally the whole supernatural element in Christianity. They deny the necessity of an atonement, considering Christ's death but as a martyrdom in defence of truth. This latter class forms the majority of the body in numbers, in intellect, and in position. — 2. A monotheist; a believer in one God, as opposed to a polytheist, or a believer in many gods. In this sense it is applicable to all Christians, Jews, and Mohammedans, as well as Deists. *Fleming*. [Rare.]

3. In *math.* the abstract expression for any unit whatsoever; any definite quantity or aggregate of quantities or magnitudes taken as one, or for which 1 is made to stand in calculation. The principle by which a uniform tenor of story and propriety of representation is preserved in literary compositions; conformity in a composition to these principles; a reference to some one purpose or leading idea in all the parts of a discourse or composition. The so-called Aristotelian law of *unity of time, of place, and of action* in a drama was the fundamental rule or general idea from which the French classical dramatic writers and critics derived, or to which they referred, all their practical rules for the construction of a drama. This law demanded that there should be no shifting of the scene from place to place, that the whole series of events should be such as might occur within the space of a single day, and that nothing should be admitted irrelevant to the development of the single plot. — 5. In *music* and the *fine arts*, such a combination of parts as to constitute a whole or a kind of symmetry of style and character; the quality of any work by which all the parts are subordinate to or promotive of one general design or effect. — 6. **Univalve** (û-ni-valv), *n.* A shell having one valve only; a mollusc with a shell composed of a single piece. The univalves formed one of the three divisions into which shells were divided by Linnaeus, the other two divisions being bivalves and multivalves; but this is not a scientific classification, and has long been given up, the term being now used only as a convenient description of certain of the mollusca. The univalves include most of

the Gasteropoda, as land-snails, sea-snails, whelks, limpets, &c. The majority of univalve shells are cone-shaped and spiral. In the simplest form the conical shape is retained without any alteration, as in the limpet. In most cases, however, the cone is elongated, sometimes forming a simple tube, as in Dentalium, but usually coiled up into a spiral. Sometimes, as in Vermetus, the coils or 'whorls' of the shell are hardly in contact, but most commonly they are so amalgamated that the inner side of each convolution is formed by the pre-existing whorl. In some cases, as in the common fresh-water Planorbis, the whorls are coiled round a central axis in the same plane, and the shell is said to be *discoidal*. In most cases, however, the whorls are wound round an axis obliquely, a true spiral being formed, and the shell becoming *turreted, trochoid, turbinated, &c.*

the telescope, instead of being a straight tube, is broken into two arms at right angles to each other in the middle of the length of the tube, and at the break a totally reflecting prism is placed, which turns the rays entering the object-glass in a rectangular direction along the eye-end of the telescope which forms part of the horizontal axis of the circle, so that the telescope becomes free to move through all altitudes. — *Universal joint*. 2. In *philos.* a general notion or idea; that which by its nature is fit to be predicated of many; that which by its nature has a fitness or capacity to be in many. Universals have been divided into *metaphysical*, or those archetypal forms existing in the divine mind and forming the patterns after which all things were created; *physical*, or certain common natures diffused over or shared in by many, as *rationality* by all men; and *logical*, or general notions framed by the human intellect, and predicated of many things, on the ground of their possessing common properties, as *animal*, which may be predicated of man, lion, horse, &c. In *anc. philos.* the universals were called *predicables*, and were arranged in five classes, *genus, species, differentia, proprium*, and *accidens*.

The same colour being observed to-day in chalk or snow which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind, and having given it the name of whiteness, it by that sound signifies the same quality wheresoever to be unaged or met with, and thus *universals*, whether ideas or terms, are made. *Locke*.

3. In *logic*, a universal proposition. See under *ADJECTIVE*.

**Universe** (û-ni-vêrs), *n.* [Fr. *univers*, from L. *universum*, the universe, neut. of the adj. *universus*, all together, all taken collectively, the whole. See *UNIVERSAL*.] The general system of things; all created things viewed as constituting one system or whole; the whole creation; the world; the *topos* of the Greeks and the *mundus* of the Latins.

For nothing this wide universe I call,  
Save thou, my rose; in it thou art my all. *Shak.*

— *World, Universe, Creation*. *World* properly signifies this globe and everything inhabiting it, as animals and vegetables, or immediately associated with it, as the atmosphere, &c. *Universe* designates the entire mass of worlds, with everything associated with them, comprehending all stars, planets, satellites, comets, &c., regarded as one system. *Creation*, in its most extended sense, is nearly synonymous with *universe*, differing from it principally in not comprehending the Great First Cause and the idea of space. It is often used in a sense limited by the epithet or qualifying word preceding it; as, the *brute creation*, the *rational creation*.

**University** (û-ni-vêrs'i-ti), *n.* [L. *universitas*, the whole of anything as contrasted with its parts, the universe; later, an association, corporation, company, &c.] 1. † The whole; the universe. 'Speaking with respect to the university of things.' *Barrow*. — 2. † A corporation; a guild. — 3. In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important branches of science and literature, and having the power of conferring certain honorary dignities, termed *degrees*, in several faculties, as arts, medicine, law, and theology. In most cases the corporations constituting universities include a body of teachers or professors for giving instruction to students; but this is not essential to a university, the staff of London University being merely an examining body. In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either by faculty or by country (hence the 'nations' into which the students were classed), or both together, its meaning being determined by the words with which it was connected. At a later period the expression *universitas literarum* (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be taught in these establishments; and it would seem that the twofold application of *universitas* led to the distinctive meaning of the term as now used. Some, forming their notion of the word *university* merely from the English universities, suppose that it necessarily means a collection and union of colleges, that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear any resemblance to the English colleges. Besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Bologna and Paris, and these formed the models on which the other universities which subsequently sprung up in various parts of Europe were established.
